Table of Contents

2. BNF Definition	8 ⁸
3. Example of a "CLASS1.0" iMelody object	11 ¹⁰

1. Overview

The iMelody format is a minimal set of tones that can be used to transfer melodies between devices. The definition can be extended by defining new formats for MIDI/WAV, DTMF, polyphonic etc. The FORMAT field is mandatory, as it is used to specify the format of the following data.

In all cases, a letter designating a note, style, volume, etc will precede a number.

Example applications include ring tones, alarm tones and power-on melodies.

```

Note : no <repeat> block within <repeat> block!(The repeat blocks cannot be nested in this simple CLASS1.0 definition)

Default octave-prefix is *4. I.e, A=880Hz

The volume can optionally be adjusted up, or down, within a repeat block, by including a V+/V- character anywhere within the repeat block. i.e (#d1r3d2e2@3V+).

The volume changes within a repeat loop continue after the loop is exited.

The default character set is UTF-8.

The file extension is imy. For example "ringring.imy"

The field name (text before the colon) is not case sensitive.

The field value (text after the colon) is case sensitive.

iMelody V1.2 Approved

A maximum length for the melody has not been defined. For interoperability, the length should be kept as short as possible. Receiving devices must be able to truncate iMelody messages longer than the device's allocated receiving buffer.

The beat is a decimal representation of the tempo in beats per minute. i.e. a bpm of 63 gives a length of a ¼ note as 0.95 sec. The beat rate has been restricted to values between 25bpm and 900bpm, to place realistic requirements on the receiving device. A default value of 120 bpm should be used if a beat is not specified.

Lines of text in the iMelody, SHOULD NOT be longer than 75 octets, excluding the line break. Long content lines SHOULD be split into a multiple line representations, using a line *folding* technique. That is, a long line can be split between any two characters, by inserting a CRLF immediately followed by a single linear white space character (i.e., SPACE, US-ASCII decimal 32 or HTAB, US-ASCII decimal 9).

BEGIN:IMELODY VERSION:1.2 FORMAT:CLASS1.0	Required Header Info
NAME:Melody1 COMPOSER:Moz art	Optional Header info
BEAT:120 STYLE:S1 VOLUME:V7	Optional iMelody modifiers

Note that in the V1.0 of the iMelody specification, the example omitted the letter V in the VOLUME modifier and S in the STYLE. Implementations should be capable of receiving the volume with, and without the letter V. Implementations should transmit with the letter V. Similarly implementations should be capable of receiving the style with, and without the letter S, but always send with an S.
