Gwin

Do you want to connect to the Internet and use services that require a GPRS connection almost for free? If you have a fixed connection, this guide is for you and will definitely save you some money.

What will we need:

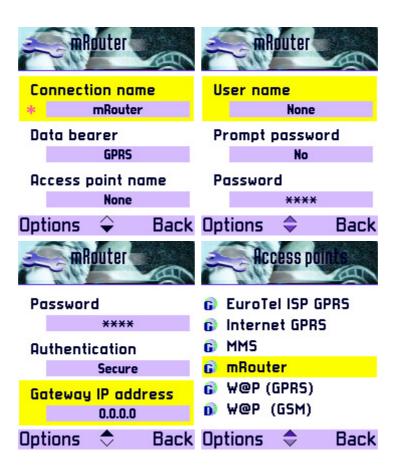

SX1

USB cable or BT or iRDA mRouter installed and working

Everything depends on the access point settings:

- 1. Create a new access point in Setup => Settings => Connection => Access Point.
- 2. Name: mRouter (you can name the access point as you like)
- 3. Data carrier: GPRS 4. Do not change

the access point name, username and password 5. Require password: **no** 6. Authentication: **secure** 7. Gateway IP address: **0.0.0.0** – this is the most important setting of the whole connection, if there is something else here, the connection will not work. 8. Done!

Now, when you want to connect via USB/BT/iRDA, always choose this access point - mRouter. Don't forget to turn on your PC.

If you want to connect via BT or iRDA, you must have these devices configured correctly.

Advantages: You don't pay for GPRS

Disadvantages: You have to have your PC on, you pay for the internet. If you don't have a fixed connection, you'll be fine. Tested on applications: Netfront, Tibia and Agile Messenger.
