

Exam : 117-102

Title : General Linux, Part 2□□□□□□

Ver : 02-25-09

QUESTION 1:

What command would load the module msdos.o and all its dependancies?

- A. modinfo -a msdos
- B. lsmod -a msdos
- C. modprobe msdos
- D. insmod -d msdos

Answer: C

Explanation: modprobe command is used to load or unload the modules as well as it's dependencies from the kernel.

To Load the module:

modprobe modulename

To unload the module

modprobe -r modulename

QUESTION 2:

What command will unload a kernel module?

- A. rmmod
- B. unmod
- C. delmod
- D. modprobe
- E. unloadmod

Answer: A

Explanation: rmmod is the simple program, which remove the modules from the kernel.

To unload module from kernel.

rmmod modulename

or

modprobe modulename

QUESTION 3:

CORRECT TEXT

The _____ command will list the currently loaded kernel modules.

Answer: lsmod

Explanation: lsmod command displays all modules loaded by kernel as well as

modules status on current session.

See the sample output of lsmod command

QUESTION 4:

CORRECT TEXT

You wish to remove a module from the kernel called fat. Assume this module has no dependencies.

Type in the simplest command to do this:

Answer: `rmmod fat`

Explanation: rmmod command removes the module from the kernel. If there are other dependencies modules then rmmod command can't remove the module.

To remove the fat module from the kernel.

rmmod fat

QUESTION 5:

You have just added new modules to your system. What command would you execute to rebuild the modules.dep file?

- A. depmod --rebuild
- B. update-dependencies
- C. depmod -a
- D. insmod -dependencies

Answer: C

Explanation:

depmod creates a list of module dependencies, by reading each module under /lib/modules/version and determining what symbols it exports, and what symbols it needs. By default this list is written to modules.dep in the same directory.

QUESTION 6:

Which of the following correctly describe the relationship between depmod and modprobe?

- A. depmod creates a dependency file for use by modprobe
- B. modprobe creates a dependency file for use by depmod
- C. they have no relationship
- D. they can replace each other

Answer: A

Explanation:

depmod creates a list of module dependencies, by reading each module under /lib/modules/version and determining what symbols it exports, and what symbols it needs. By default this list is written to modules.dep in the same directory.

modprobe command is used to load or unload the modules as well as it's dependencies from the kernel.

To Load the module:

modprobe modulename

To unload the module

modprobe -r modulename

QUESTION 7:

The normal use of depmod is to include which of the following lines in one of the files in /etc/rc.d so the correct module dependencies will be available after booting the system?

- A. /sbin/depmod -a
- B. /sbin/depmod -p
- C. /sbin/depmod -r
- D. /sbin/depmod -c

Answer: A

Explanation:

depmod creates a list of module dependencies, by reading each module under /lib/modules/version and determining what symbols it exports, and what symbols it needs. By default this list is written to modules.dep in the same directory. The normal use of depmod is to include the line /sbin/depmod -a in one of the files in /etc/rc.d so the correct module dependencies will be available after booting the system.

QUESTION 8:

What command option of depmod allows you to print a list of all unresolved symbols?

- A. -e
- B. -l
- C. -i
- D. -a

Answer: A

Explanation: depmod creates a list of module dependencies, by reading each module under /lib/modules/version and determining what symbols it exports, and what symbols it needs. By default this list is written to modules.dep in the same directory. The normal use of depmod is to include the line /sbin/depmod -a in one of the files in /etc/rc.d so the correct module dependencies will be available after booting the system. depmod -e prints a list of all unresolved symbols.

QUESTION 9:

Which of the following commands loads the module file into the kernel and changes any symbols that are defined on the command line?

- A. insmod
- B. depmod

- C. modprobe
- D. setmod

Answer: A

Explanation: insmod is a system administration command. Load the module file into the kernel, changing any symbols that are defined on the command line. If the module file is named file.o or file.mod, the module will be named file.

QUESTION 10:

What option of the insmod command can you use to force the loading of module even if problems are encountered?

- A. -f
- B. -F
- C. -u
- D. -r

Answer: A

Explanation: insmod is a system administration command. -f: Force loading of module, even if some problems are encountered.

QUESTION 11:

Which of the following commands installs a loadable module in the running kernel?

- A. insmod
- B. depmod
- C. modprobe
- D. setmod

Answer: A

Explanation: insmod installs a loadable module in the running kernel. It tries to link a module into the running kernel by resolving all symbols from the kernel's exported symbol table.

QUESTION 12:

insmod tries to link a module into the running kernel by resolving all symbols obtained from:

- A. the kernel's exported symbol table.
- B. the kernel's internal pointer base.

- C. the user command argument list.
- D. None of the choices

Answer: A

Explanation: insmod installs a loadable module in the running kernel. It tries to link a module into the running kernel by resolving all symbols from the kernel's exported symbol table.

QUESTION 13:

With insmod, the paths listed in /etc/modules.conf override the paths defined in MODPATH.

- A. true
- B. false

Answer: A

Explanation: If the module file name is given without directories or extension, insmod will search for the module in some common default directories. The environment variable MODPATH can be used to override this default. If a module configuration file such as /etc/modules.conf or /etc/modprobe.conf exists, it will override the paths defined in MODPATH.

QUESTION 14:

Lsmmod shows information about:

- A. all loaded modules
- B. all updatable modules
- C. all non-updatable modules
- D. all unloaded modules

Answer: A

Explanation: Lsmmod shows information about all loaded modules as well as the status of loaded modules. The format is name, size, use count, list of referring modules. The information displayed is identical to that available from /proc/modules.

QUESTION 15:

Lsmmod shows information in which of the following formats?

- A. name, size, use count, list of referring modules

- B. name, use count, list of referring modules, size
- C. name, size, list of referring modules, use count
- D. None of the choices

Answer: A

Explanation: lsmod shows information about all loaded modules. The format is name, size, use count, list of referring modules. The information displayed is identical to that available from /proc/modules.

See the sample output

QUESTION 17:

What command should you use to unload loadable modules from the running kernel?

- A. rmmod
- B. remove -mod
- C. delmod
- D. unload module

Answer: A

Explanation: Rmmod unloads loadable modules from the running kernel. Rmmod tries to unload a set of modules from the kernel, with the restriction that they are not in use and that they are not referred to by other modules. If more than one module is named on the command line, the modules will be removed simultaneously. This supports unloading of stacked modules.

QUESTION 18:

What command option of rmmod specifies that all outputs be sent to syslog?

- A. -a
- B. -i
- C. -s
- D. -d

Answer: C

Explanation: rmmod unloads loadable modules from the running kernel. -s: Output everything to syslog instead of the terminal.

Syntax:

Rmmod -s or --syslog modulename

Where -s or --syslog à Send errors to the syslog, instead of standard error.

QUESTION 19:

What utility examines the object file module_file associated with a kernel module and displays any information that it can glean?

- A. modinfo
- B. modprobe

- C. insmod
- D. depmod

Answer: A

Explanation: modinfo extracts information the Linux Kernel modules given on the command line. If the module name is not a filename, then the /lib/modules/version directory is searched, as done by modprobe

Syntax: modinfo modulename or filename

Example:

modinfo ext3

Sample output

filename: /lib/modules/2.6.9-5.EL/kernel/fs/ext3/ext3.ko

author: Remy Card, Stephen Tweedie, Andrew Morton, Andreas Dilger, Theodore Ts'o and others

description: Second Extended Filesystem with journaling extensions

license: GPL

vermagic: 2.6.9-5.EL 686 REGPARM 4KSTACKS gcc-3.4

depends: jbd

QUESTION 20:

What command option of modinfo can display its version number?

- A. -V
- B. -i
- C. -I
- D. -A

Answer: A

Explanation: -V option is used to display the version number of modules.

Example:

modinfo -V ext3

output like

module-init-tools version 3.1-pre5

QUESTION 21:

What option of modprobe specifies the loading of all matching modules instead of stopping after the first successful loading?

- A. -a
- B. -f
- C. -c
- D. -e

Answer: A

Explanation: -a, --all: Load all matching modules instead of stopping after the first successful loading.

QUESTION 22:

What option of modprobe allows you to set 'autoclean' on the loaded modules?

- A. -k
- B. -d
- C. -c
- D. -e

Answer: A

Explanation: -k, --autoclean: Set 'autoclean' on loaded modules. Used by the kernel when it calls on modprobe to satisfy a missing feature (supplied as a module). The -q option is implied by -k. These options will automatically be sent to insmod.

QUESTION 23:

Modprobe can be used to load (choose all that apply):

- A. a single module
- B. a stack of dependent modules
- C. all modules that are marked with a specified tag
- D. None of the choices

Answer: A,B,C

Modprobe is used to load a single module, a stack of dependent modules, or all modules that are marked with a specified tag.

QUESTION 24:

Modprobe will automatically load all base modules needed in the module stack as described by its dependency file. What file is this?

- A. modules.dep
- B. modprobe.dep
- C. module.dep
- D. modep.dep

Answer: A

Explanation: depmod creates a list of module dependencies, by reading each module under /lib/modules/version and determining what symbols it exports, and what symbols it needs. By default this list is written to modules.dep in the same directory. The normal use of depmod is to include the line /sbin/depmod -a in one of the files in /etc/rc.d so the correct module dependencies will be available after booting the system. depmod -e prints a list of all unresolved symbols.

When you tried to load the modules using modprobe command it checks the modules.dep file generated by depmod command to identify the dependencies and load all dependencies as well .

QUESTION 25:

CORRECT TEXT

Which utility is used to create or update the modules.dep file? Type the command only.

Answer: depmod

Explanation: depmod creates a list of module dependencies, by reading each module under /lib/modules/version and determining what symbols it exports, and what symbols it needs. By default this list is written to modules.dep in the same directory. The normal use of depmod is to include the line /sbin/depmod -a in one of the files in /etc/rc.d so the correct module dependencies will be available after booting the system. depmod -e prints a list of all unresolved symbols.

QUESTION 26:

CORRECT TEXT

Type in the simplest command to list all loaded modules:

Answer: lsmod

Explanation: lsmod shows information about all loaded modules. The format is name, size, use count, list of referring modules. The information displayed is identical to that available from /proc/modules.

QUESTION 27:

CORRECT TEXT

You wish to get information on a module called msdos.o. Type in the simplest command that would list all information including author and description for the module:

Answer: modinfo msdos

Explanation: modinfo extracts information the Linux Kernel modules given on the

command line. If the module name is not a filename, then the /lib/modules/version directory is searched, as done by modprobe

Syntax: modinfo modulename or filename

Example:

modinfo ext3

Sample output

filename: /lib/modules/2.6.9-5.EL/kernel/fs/ext3/ext3.ko

author: Remy Card, Stephen Tweedie, Andrew Morton, Andreas Dilger, Theodore Ts'o and others

description: Second Extended Filesystem with journaling extensions

license: GPL

vermagic: 2.6.9-5.EL 686 REGPARM 4KSTACKS gcc-3.4

depends: jbd

QUESTION 28:

CORRECT TEXT

You have a module called msdos.o which has a dependancy on fat.o. What single command will load msdos.o and its dependant fat.o module in one command line?

Answer: modprobe msdos

Explanation: modprobe command load the modules with it's all dependencies by reading modules.dep file.

QUESTION 29:

CORRECT TEXT

Type in the simplest command, including any switches, to rebuild the modules.dep file after you have made changes to the modules.conf file:

Answer: depmod -a

Explanation: depmod creates a list of module dependencies, by reading each module under /lib/modules/version and determining what symbols it exports, and what symbols it needs. By default this list is written to modules.dep in the same directory. The normal use of depmod is to include the line /sbin/depmod -a in one of the files in /etc/rc.d so the correct module dependencies will be available after booting the system. depmod -e prints a list of all unresolved symbols.

QUESTION 30:

CORRECT TEXT

Type in the command to list your current kernel version, including any switches:

Answer: uname -a

Answer: `uname -r`

Explanation: `uname` command print the system information ie kernel version, kernel name, machine hardware name etc.

Syntax: `uname [option]`

Options: `-a` or `-all` à print all information, in the following order:

`-r` or `--kernel-release` à print the kernel release

QUESTION 31:

CORRECT TEXT

You wish to install the module `fat.o` into the kernel. Type in the simplest command to do this, assuming there are no dependencies for this module:

Answer: `insmod fat`

Explanation: `insmod` is a command insert the module into the kernel but it can't resolves the dependencies so to load the module into the kernel with dependencies use the `modprobe` command.

QUESTION 32:

What `modprobe` option will cause inactive kernel modules to be unloaded?

- A. `autoclean`
- B. `inactive`
- C. `remove`
- D. `timeout`
- E. `holdoff`

Answer: A

Explanation: `modprobe -k` or `--autoclean` option will cause inactive kernel modules to be unloaded.

QUESTION 33:

CORRECT TEXT

You are using `insmod`. You do not want to use the default configuration file `/etc/modules.conf`. What environment variable should you modify?

Answer: `MODULECONF`

Explanation: The environment variable `MODULECONF` can also be used to select a different configuration file from the default `/etc/modules.conf` or

/etc/modprobe.conf (or /etc/conf.modules (deprecated)). This environment variable will override all the definitions above.

QUESTION 34:

You can find out how much memory the kernel is using by taking the total amount of memory in your machine and subtracting from it the amount of:

- A. "total mem" in /proc/meminfo
- B. "total mem" in /proc/memused
- C. "total mem" in /proc/memcurrent
- D. None of the choices

Answer: A

Explanation: You can find out how much memory the kernel is using by taking the total amount of memory in your machine and subtracting from it the amount of ``total mem" in /proc/meminfo or the output of the command `free'.

See the sample output of /proc/meminfo

MemTotal: 118180 kB

MemFree: 19108 kB

Buffers: 4800 kB

Cached: 37860 kB

total used free shared buffers cached

Mem: 115 96 18 0 4 37
-/+ buffers/cache: 55 60
Swap: 509 0 509

QUESTION 35:

CORRECT TEXT

What command will load groups of modules into the kernel as needed?

Answer: modprobe

Explanation: modprobe command load the modules with it's all dependencies by reading modules.dep file.

QUESTION 36:

CORRECT TEXT

If the module file name is given without directories or extension, insmod will search for the module in some common default directories. What environment variable can be used to override this?

Answer: MODPATH

Explanation:

If the module file name is given without directories or extension, insmod will search for the module in some common default directories. The environment variable MODPATH can be used to override this default. If a module configuration file such as /etc/modules.conf exists, it will override the paths defined in MODPATH.

QUESTION 37:

Which of the following could be used to load kernel modules for a 2.4.x kernel?

- A. vi/proc/modules
- B. rmmod
- C. kmod
- D. depmod

Answer: C

Explanation: in 2.4.x version kernel, kmod command is used to load the modules.

QUESTION 38:

Loadable kernel modules can (choose all that apply):

- A. save memory
- B. ease configuration
- C. include filesystems
- D. include ethernet card drivers

Answer: A,B,C,D

Explanation: Loadable kernel modules can save memory and ease configuration. The scope of modules has grown to include filesystems, ethernet card drivers, tape drivers, printer drivers, and more.

QUESTION 39:

What command would rebuild the ld.so.cache file?

- A. ldd
- B. ldconfig
- C. ld.so.cache -rebuild
- D. ld

Answer: B

Explanation:

ldconfig creates the necessary links and cache to the most recent shared libraries found in the directories specified on the command line, in the file /etc/ld.so.conf, and in the trusted directories (/lib and /usr/lib). The cache is used by the run-time linker, ld.so or ld-linux.so. ldconfig checks the header and file names of the libraries it encounters when determining which versions should have their links updated.

QUESTION 40:

What file should be edited to make the system aware of newly added library files?

- A. /etc/modules.conf
- B. /etc/conf.modules
- C. /etc/ld.so.conf
- D. /etc/ld.so.cache
- E. /etc/LD_LIBRARY_PATH.conf

Answer: C

Explanation:

ldconfig creates the necessary links and cache to the most recent shared libraries found in the directories specified on the command line, in the file /etc/ld.so.conf, and in the trusted directories (/lib and /usr/lib). The cache is used by the run-time linker, ld.so or ld-linux.so. ldconfig checks the header and file names of the libraries it

encounters when determining which versions should have their links updated.

Some files:

/lib/ld.so run-time linker/loader

/etc/ld.so.conf File containing a list of colon, space, tab, newline, or comma separated directories in which to search for libraries.

/etc/ld.so.cache File containing an ordered list of libraries found in the directories specified in /etc/ld.so.conf

QUESTION 41:

The command "make config" requires bash.

A. true

B. false

Answer: A

Explanation The command `make config` while in /usr/src/linux starts a configure script which asks you many questions. It requires bash, so verify that bash is /bin/bash, /bin/sh, or \$BASH.

QUESTION 42:

CORRECT TEXT

If you need to view per-user disk space usage on a filesystem, the _____ command can provide that information if the kernel is built to support it.

Answer: du

Explanation:

du - estimate file space usage

example: du -h file/directory.

QUESTION 43:

Rate this advice: In order to use the latest kernel, it is necessary to first upgrade to the newest utilities and libraries.

A. True

B. False

Answer: A

Explanation: In order to use the latest kernel, it is first necessary to upgrade to the newest utilities and libraries.

QUESTION 44:

CORRECT TEXT

What is the name of the Kernel configuration file? Type just the filename.

Answer: .config

Explanation: config hidden file is the kernel configuration file so while you recompile the kernel, you should copy the .config file into /boot.

Example:

```
cp .config /boot/config-2.4.17
```

QUESTION 45:

GNU Make determines which pieces of a large program need to be recompiled and issues the commands to recompile them when necessary.

A. true

B. false

Answer: A

Explanation GNU Make is a program that determines which pieces of a large program need to be recompiled and issues the commands to recompile them, when necessary.

QUESTION 46:

What does "make bzImage" do as opposed to "make zImage"?

A. makes a bz encrypted kernel

B. makes a kernel with a better compression ratio

C. makes a kernel with built in gzip application

D. nothing

Answer: B

Explanation:

As the Kbuild documentation states:

Some computers won't work with 'make bzImage', either due to hardware problems or very old versions of lilo or loadlin. If your kernel image is small, you may use 'make zImage', 'make zdisk', or 'make zlilo' on these systems.

QUESTION 47:

You have just recompiled a new kernel and rebooted your system with the new kernel. Unfortunately you are getting "Can't locate module" error messages. Which of the following is most likely to be the source of the problem?

- A. You copied the modules to the wrong directory.
- B. You did not configure modular support into the kernel.
- C. You did not run depmod after installing the modules.
- D. You did not install the modules.

Answer: B

Explanation:

There is one more step needed for the build process, however. You have created the kernel, but now you need to create all the loadable modules if you have them configured. Be aware that typical distribution kernels tend to have almost every feature installed, plus a few others for good measure. These can typically take an hour or so to build on our Athlon XP1800. The stock kernels are somewhat leaner by default and take, on average, 25 minutes to compile. To build the modules we run:

```
$ make modules
```

If you forget to enter make modules command, you will get that message.

Follow these steps while recompile the kernel.

Installation steps

```
cd /usr/src/bzcat linux-2.4.17.tar.bz | tar xvf -cd linuxmake config | make menuconfig  
| make xconfigmake depmake cleanmake bzImagemake modules (if modular  
kernel)make modules_install (if modular kernel)cp System.map  
/boot/System.map-2.4.17cp arch/i386/boot/bzImage /boot/vmlinuz-2.4.17cp .config  
/boot/config-2.4.17mkinitrd /boot/initrd-<version> <kernel version> # Depending on  
kernel configurationUpdate LILO or GRUBReboot into new kernel
```

QUESTION 48:

When preparing to compile a new kernel, which of the following commands can be used to create the configuration file?

- A. make config
- B. make kernel
- C. ./configure
- D. make kernelconfig
- E. [Kernel Source Path]/Configure

Answer: A

Explanation: while recompile the kernel, we can use config or oldconfig or menuconfig or xconfig command to create the configuration file.

QUESTION 49:

If your new kernel does not behave normally after a routine kernel upgrade,

chances are that you forgot to _____ before compiling the new kernel.

- A. make clean
- B. make shot
- C. make clear
- D. make remove

Answer: A

Explanation: If your new kernel does really weird things after a routine kernel upgrade, chances are you forgot to make clean before compiling the new kernel. Symptoms can be anything from your system outright crashing, strange I/O problems, to crummy performance. Make sure you do a make dep, too.

QUESTION 50:

Upgrading a kernel involves which of the following tasks (choose all that apply):

- A. configuring the desired modules
- B. compiling the kernel and modules
- C. installing the kernel image
- D. conducting a system reboot

Answer: A,B,C,D

Explanation: Upgrading the kernel involves configuring desired modules, compiling the kernel and modules, and finally installing the kernel image. This is followed by a system reboot (with fingers crossed!) to load the new kernel. All of this is documented in the ``README" file which comes with each kernel package. Further information can be found in the ``Documentation/" subdirectory. A particularly helpful file there is ``Configure.help" which contains detailed information on the available kernel compile options and modules.

QUESTION 51:

Which of the following insures that all of the dependencies, such as the include files, are in place?

- A. make dep
- B. make clean
- C. make_dep
- D. make_install

Answer: A

Explanation: When the configure script ends, it also tells you to `make dep' and

(possibly) ``clean'`. So, do the ``make dep'`. This insures that all of the dependencies, such the include files, are in place. It does not take long, unless your computer is fairly slow to begin with. For older versions of the kernel, when finished, you should do a ``make clean'`. This removes all of the object files and some other things that an old version leaves behind. In any case, do not forget this step before attempting to recompile a kernel.

QUESTION 52:

Incremental upgrades of the kernel are distributed as:

- A. patches.
- B. fixes.
- C. hotfixes.
- D. service packs.

Answer: A

Explanation: Incremental upgrades of the kernel are distributed as patches. For example, if you have version 1.1.45, and you notice that there's a ``patch46.gz'` out there for it, it means you can upgrade to version 1.1.46 through application of the patch. You might want to make a backup of the source tree first (``make clean'` and then `cd/usr/src;tar zcvf old-tree.tar.gz linux'` will make a compressed tar archive for you.).

QUESTION 53:

Which of the following removes all of the object files and some other things that an old version leaves behind?

- A. `make dep`
- B. `make clean`
- C. `make_dep`
- D. `make_install`

Answer: B

Explanation When the configure script ends, it also tells you to ``make dep'` and (possibly) ``clean'`. So, do the ``make dep'`. This insures that all of the dependencies, such the include files, are in place. It does not take long, unless your computer is fairly slow to begin with. For older versions of the kernel, when finished, you should do a ``make clean'`. This removes all of the object files and some other things that an old version leaves behind. In any case, do not forget this step before attempting to recompile a kernel.

QUESTION 54:

What command will compile the Linux kernel and leave a file in `arch/i386/boot`

called bzImage?

- A. make bzImage
- B. make compile
- C. make Image
- D. make bzdisk

Answer: A

Explanation After depending and cleaning, you may now `make bzImage' or `make bzdisk' (this is the part that takes a long time.). `make bzImage' will compile the kernel, and leave a file in arch/i386/boot called `bzImage' (among other things). This is the new compressed kernel. `make bzdisk' does the same thing, but also places the new bzImage on a floppy disk which you hopefully put in drive ``A:". `bzdisk' is fairly handy for testing new kernels; if it bombs (or just 'work right '), just remove the floppy and boot with your old kernel. It can also be a handy way to boot if you accidentally remove your kernel (or something equally as dreadful).

QUESTION 55:

What command will compile the Linux kernel and leave a file called bzImage in the floppy disk?

- A. make bzImage
- B. make compile
- C. make Image
- D. make bzdisk

Answer: D

Explanation After depending and cleaning, you may now `make bzImage' or `make bzdisk' (this is the part that takes a long time.). `make bzImage' will compile the kernel, and leave a file in arch/i386/boot called `bzImage' (among other things). This is the new compressed kernel. `make bzdisk' does the same thing, but also places the new bzImage on a floppy disk which you hopefully put in drive ``A:". `bzdisk' is fairly handy for testing new kernels; if it bombs (or just doesn't work right), just remove the floppy and boot with your old kernel. It can also be a handy way to boot if you accidentally remove your kernel (or something equally as dreadful).

QUESTION 56:

Which of the following commands will attempt to configure the kernel from an old configuration file and run through the make config process for you?

- A. make oldconfig
- B. make newconfig
- C. make clean
- D. None of the choices

Answer: A

Explanation Make oldconfig' will attempt to configure the kernel from an old configure file;it will run through make config process for you if you havent ever compiled a kernel before or don't have an old config file, then you probably shouldn't do this, as you will most likely want to change the default configuration.

QUESTION 57:

CORRECT TEXT

To produce a compiled kernel with slightly better than standard compression, type the command with and any options and arguments to accomplish just the compilation.

Answer: make bzImage

QUESTION 58:

CORRECT TEXT

You are using X and wish to build a new kernel. What X tool would you use to build the .config file. Type in just the command, not the switches:

Answer: make xconfig

Explanation:

xconfig is a graphical frontend using qconf by Roman Zippel. It requires the qt and X libraries to build and use. The interface is intuitive and customizable. Online help is automatically shown for each kernel configuration option. It also can show dependency information for each module which can help diagnose build errors.

QUESTION 59:

CORRECT TEXT

Type in the command to compile a kernel image with normal compression:

Answer: make zImage

Explanation: finally ready to start the actual kernel build with make bzimage command. At the prompt type:
make bzImage it will create the kernel image with normal compression.

QUESTION 60:

Which of the following is not a valid make command during a kernel recompile?

- A. make dep
- B. make clean
- C. make xconfig
- D. make modules
- E. make bzImage

Answer: E

Explanation:

We are now (finally) ready to start the actual kernel build. At the prompt type:
make bzImage

Some computers won't work with 'make bzImage', either due to hardware problems or very old versions of lilo or loadlin. If your kernel image is small, you may use 'make zImage', 'make zdisk', or 'make zlilo' on these systems

Steps to recompile the Kernel

1. cd /usr/src
2. bzcat linux-4.17.tar.bz2 | tar xvf -
3. cd linux
4. make config | make menuconfig | make xconfig
5. make dep
6. make clean
7. make bzImage
8. make modules (if modular kernel)
9. make modules_install (if modular kernel)
10. cp System.map /boot/System.map-2.4.17
11. cp arch/i386/boot/bzImage /boot/vmlinuz-2.4.17
12. cp .config /boot/config-2.4.17
13. mkinitrd /boot/initrd-
<version> <kernel version> # Depending on kernel configuration
14. Update LILO or GRUB
15. Reboot into new kernel

QUESTION 61:

CORRECT TEXT

You are working on a non graphical shell.

What command would you use to configure the kernel using a menu system.

Type the command and its argument(s).

Answer: make menuconfig

Explanation menuconfig is an ncurses-based frontend. Your system must have the ncurses-devel libraries installed in order to use this utility. As the help text at the top of the screen indicates, use the arrow keys to navigate the menu. Press Enter to select

sub-menus. Press the highlighted letter on each option to jump directly to that option. To build an option directly into the kernel, press Y. To disable an option entirely, press N

QUESTION 62:

Which of the following correctly describe a Monolithic Kernel (choose all that apply):

- A. it is built into one single binary.
- B. it is loaded completely into memory at boot time.
- C. it pre-dates micro-kernel architecture by at least ten years.
- D. None of the choices

Answer: A,B,C

Explanation: There are two types of kernel, modular and monolithic. Modular kernel has different modules to support different devices, filesystem etc but monolithic is one single bundle file.

Have everything they need in that binary.

Are loaded completely into memory at boot time.

Pre-date micro-kernel architecture by at least ten years.

QUESTION 63:

Which of the following correctly describe a Micro-kernel Architecture (choose all that apply):

- A. it has an extremely small core.
- B. only its small core remains in memory at all times.
- C. its device drivers are loaded as-needed.
- D. None of the choices

Answer: A,B,C

Explanation:

Micro-kernel Architectures:

Have an extremely small core.

Only the small core remains in memory at all times.

Device drivers and other additional items are loaded as-needed.

QUESTION 64:

Rate this comment: Linux by and large is monolithic.

- A. true
- B. false

Answer: A

Explanation:

Is Linux Purely Monolithic?

Linux by and large is monolithic. However, Linux permits modules, a system whereby certain parts of the kernel may be loaded at runtime. Linux modules are reminiscent of micro-kernel architectures, but Linux really remains basically a monolithic architecture.

QUESTION 65:

On a debian system which of the following would build a boot disk

- A. mkboot /dev/floppy
- B. makeboot --device /dev/fd0 2.4.18-12
- C. mkboot --device /dev/fd0 2.4.18-12
- D. mkboot /boot/vmlinux-2.4.18-12
- E. mkbootdisk /boot/vmlinux-2.4.18-12

Answer: C

Explanation:

mkboot creates a boot floppy appropriate for the running system. The boot disk is entirely self-contained, and includes an initial ramdisk image which loads any necessary SCSI modules for the system. The created boot disk looks for the root filesystem on the device suggested by /etc/fstab. The only required argument is the kernel version to put onto the boot floppy.

Syntax: mkbootdisk [options] kernel version.

By default mkboot creates the boot disk on first floppy device. If you want to specify the device use the --device option. In debian you should specify the kernel filename which resides on /boot.

QUESTION 66:

CORRECT TEXT

On a Red Hat system, with a single floppy drive and a returned output from the uname command of 2.4.20-12, what exact command string will create a customized boot disk for this system? Type the full command string to accomplish this.

Answer: mkbootdisk --device /dev/fd0 2.4.20-12

Explanation:

mkbootdisk creates a boot floppy appropriate for the running system. The boot disk is entirely self-contained, and includes an initial ramdisk image which loads any necessary SCSI modules for the system. The created boot disk looks for the root filesystem on the device suggested by /etc/fstab. The only required argument is the kernel version to put

onto the boot floppy.

Syntax: mkbootdisk [options] kernel version.

By default mkbootdisk creates the boot disk on first floppy device. If you want to specify the device use the --device option.

We can print the kernel version using uname -r command.

QUESTION 67:

CORRECT TEXT

On a Debian-based system, what command will create a boot disk on the first floppy if your kernel image is named "vmlinux-2.4.18-4"? Type the full command string to accomplish this.

Answer: mkboot vmlinux-2.4.18-4

Answer: mkboot /boot/vmlinux-2.4.18-4

Explanation:

mkboot creates a boot floppy appropriate for the running system. The boot disk is entirely self-contained, and includes an initial ramdisk image which loads any necessary SCSI modules for the system. The created boot disk looks for the root filesystem on the device suggested by /etc/fstab. The only required argument is the kernel version to put onto the boot floppy.

Syntax: mkbootdisk [options] kernel version.

By default mkboot creates the boot disk on first floppy device. If you want to specify the device use the --device option. In debian you should specify the kernel filename which resides on /boot.

QUESTION 68:

CORRECT TEXT

You want to create a boot floppy using a given image file on your hard disk. What utility would you use to do so?

Answer: mkbootdisk --device /dev/fd0 `uname -r`

Explanation:

mkbootdisk creates a boot floppy appropriate for the running system. The boot disk is entirely self-contained, and includes an initial ramdisk image which loads any necessary SCSI modules for the system. The created boot disk looks for the root filesystem on the device suggested by /etc/fstab. The only required argument is the kernel version to put onto the boot floppy.

Syntax: mkbootdisk [options] kernel version.

By default mkbootdisk creates the boot disk on first floppy device. If you want to specify the device use the --device option.

We can print the kernel version using uname -r command.

QUESTION 69:

CORRECT TEXT

To exclude all log messages of a given logging facility, you should use a logging priority of:

Answer: none

Explanation: You can see on /etc/syslog.conf configuration file to store the log messages about the proper facility. The pattern is facility.priority,

Example

mail.* à it means mail related all priority.

If you want to exclude all log messages of facility use none priority.

Eg. cron.none

QUESTION 70:

You are having some trouble with a disk partition and you need to do maintenance on this partition but your users home directories are on it and several are logged in. Which command would disconnect the users and allow you to safely execute maintenance tasks?

- A. telinit 1
- B. shutdown -r now
- C. killall -9 inetd
- D. /bin/netstop --maint
- E. /etc/rc.d/init.d/network stop

Answer: E

Explanation: The network services allows users to logged in from other different host. If you stop the network service it disconnect to all users.

/etc/rc.d/init.d/ directory contains all services.

To start the service

service servicename start or restart

To stop the service

service servicename stop

QUESTION 71:

Some loadable kernel modules accept options at load time. This can be used to set interrupt or IO addresses, for example. The place to set these options is?

- A. /etc/conf.modules
- B. /etc/lilo.conf

- C. /boot/System.map
- D. /etc/sysconfig
- E. /boot/module-info

Answer: E

QUESTION 72:

Which of the following commands can be used to view kernel messages?

- A. less dmesg
- B. less /var/log/boot.log
- C. cat /proc/kernel |less
- D. cat /proc/dmesg

Answer: B

Explanation: There are two log files contains the boot and kernel related log messages. /var/log/boot.log and /var/log/dmesg.

QUESTION 73:

CORRECT TEXT

Which command will display messages from the kernel that were output during the normal bootup sequence?

Answer: dmesg

Explanation: dmesg is the program helps users to print out their bootup messages. Either cat /var/log/dmesg or use dmesg command

QUESTION 74:

Which bootloader can lie to Windows and make Windows believe that it's installed on the first partition even if it's not?

- A. GRUB
- B. XLoad
- C. LILO
- D. FILO

Answer: A

Explanation GRUB differs from bootloaders such as LILO in that it can lie to Windows and make Windows believe that it's installed on the first partition even if it's not. So you can keep your current Linux system where it is and install Windows on the side.

QUESTION 75:

CORRECT TEXT

On your system exists a file that is described as a map file that is used to update the MBR or first sector of the partition with the appropriate booting information. Type the full path and name of the file:

Answer: /etc/lilo.conf

Explanation: /etc/lilo.conf is the file used by lilo command to update the MBR or first sector of the partition with the appropriate booting information ie. root partition, kernel file etc.

QUESTION 76:

CORRECT TEXT

When booting your system, you believe you saw an error message go by too quickly to see. Type in the command that will show the last system bootup messages:

Answer: dmesg

Explanation: dmesg is the program helps users to print out their bootup messages. Either cat /var/log/dmesg or use dmesg command

QUESTION 77:

CORRECT TEXT

The dmesg command outputs information from which file, include full path?

Answer: /var/log/dmesg

Explanation: dmesg is the program helps users to print out their bootup messages. Either cat /var/log/dmesg or use dmesg command

QUESTION 78:

CORRECT TEXT

You have made changes to your /etc/lilo.conf file. Type in the simplest command that will reload the configuration to the MBR:

Answer: lilo

Explanation: /etc/lilo.conf is the file used by lilo command to update the MBR or first sector of the partition with the appropriate booting information ie. root partition, kernel file etc. After reconfiguring the file you should update the MBR or first sector of boot partition using lilo command.

QUESTION 79:

Where can you specify options that affect the booting of the system?

- A. /etc/lilo.conf
- B. boot= prompt
- C. linux:
- D. init 3
- E. init 5

Answer: A, B

Explanation: To effect the system booting, you can specify the options of kernel arguments on bootloader configuration file ie. lilo.conf or bootloader prompt.

QUESTION 80:

Where can the lilo command install the boot menu and information? Choose all that apply:

- A. Master Boot Record
- B. BIOS
- C. First Sector of a Partition
- D. BootBlk
- E. Boot Prom

Answer: A, C

Explanation: lilo command update the MBR or first sector of boot partition, it depends on where you installed the boot loader.

QUESTION 81:

CORRECT TEXT

You boot a freshly installed system loaded with all the defaults, xdm loads and crashes, and the system halts. How can you force the system to multi-user text mode with networking from the LILO: or boot: prompt?

Answer: linux 3

Explanation: There is a configuration file named /etc/inittab contains default runlevel, run level specific scripts etc. If you want to boot the system other than default runlevel you can pass the kernel argument from boot loader.

When you get the lilo screen, press ctrl+x and type linux runlevel.

The available runlevel are

0 - halt (Do NOT set initdefault to this)

1 - Single user mode

2 - Multiuser, without NFS (The same as 3, if you do not have networking)

3 - Full multiuser mode

4 - unused

5 - X11

6 - reboot (Do NOT set initdefault to this)

Runlevel 3 is called multi user so you should boot your system on run level 3 using
linux 3

QUESTION 82:

CORRECT TEXT

You wish to notify all users that you have to take down a service on which they rely. What command will allow you to send a message to all currently logged on users? Enter only the command, not the path.

Answer: shutdown

Explanation:

shutdown brings the system down in a secure way. All logged-in users are notified that the system is going down, and login is blocked. It is possible to shut the system down immediately or after a specified delay. All processes are first notified that the system is going down by the signal SIGTERM. This gives programs like vi the time to save the file being edited, mail and news processing programs a chance to exit cleanly.

You can use the -k option to send the warning message to all logged in users without really shutdown down the system.

QUESTION 83:

CORRECT TEXT

What is considered the normal exit value of a process?

Answer: 0

Answer: zero

Explanation: If any process exit with normal status that process return the zero.

QUESTION 84:

You've just rebooted your server. Users complain that the server is refusing secure connections.

Which of the following is most likely causing this problem?

- A. The clients are not resolving the server name properly.
- B. sshd is not configured to start in the default runlevel.
- C. sshd is using tcpwrappers for security.
- D. The public keys have been corrupted on the server.
- E. The users need to restart their ssh-agent.

Answer: B

Explanation: To enable the ssh connection sshd service should start. Probably on first reboot sshd service is not started. So you should start the sshd service.

To start sshd service

service sshd start

To start sshd service automatically on next reboot

chkconfig sshd on

QUESTION 85:

Your server was rebooted. Users have complained that the server refuses secured connections.

What is the mostly likely cause?

- A. The public keys have been corrupted on the server.
- B. The clients are not resolving the server name properly.
- C. Sshd is not configured to start in the default runlevel.
- D. The users need to ssh-keygen.

Answer: C

Explanation: To enable the ssh connection sshd service should start. Probably on first reboot sshd service is not started. So you should start the sshd service.

To start sshd service

service sshd start

To start sshd service automatically on next reboot

chkconfig sshd on

QUESTION 86:

What runlevels should never be declared as the default runlevel in /etc/inittab?

- A. 1
- B. 3
- C. 5
- D. 6

Answer: A, D

Explanation:

Standard Runlevel are:

0 - halt (Do NOT set initdefault to this)

1 - Single user mode

2 - Multiuser, without NFS (The same as 3, if you do not have networking)

3 - Full multiuser mode

4 - unused

5 - X11

6 - reboot (Do NOT set initdefault to this)

1 means single user mode and 6 means reboot. Which are not recommended for default runlevel.

QUESTION 87:

CORRECT TEXT

Type in the simplest command to display the previous and current run level:

Answer: runlevel

Explanation:

runlevel -- find the current and previous system runlevel.

See the output of runlevel

N 3 àIt means currently system running on runlevel 3 and not switched to any runlevel.

QUESTION 88:

CORRECT TEXT

You are in run level 5 and wish to change to run level 1. Type in the simplest command to do this:

Answer: init 1

Answer: init s

Answer: init S

Explanation: runlevel command displays the current and previous runlevel. To change runlevel from the command line, use

init runlevel

So, to change in runlevel init 1

QUESTION 89:

You need to change the default runlevel. Which file do you need to edit? (Write the

full path including the filename)

- A. /etc/init.d
- B. /etc/init-table
- C. /etc/inittab
- D. /etc/init

Answer: C

Explanation: The file /etc/inittab contains the default run level as well as run level specific scripts.

id:3:initdefault:

If you haven't specified the run level system boots on run level 9 that is unknown run level.

QUESTION 90:

CORRECT TEXT

You wish to change the daemons that start at a run level 3. Type in the command that would give a text menu based application to set the daemons for this runlevel:

Answer: ntsysv --level 3

Explanation:

ntsysv is a simple interface for configuring runlevel services which are also configurable through chkconfig. By default, it configures the current runlevel. If the user would like to configure other runlevels, those levels can be specified on the command line by listing the levels after --levels, without any spaces. For example, the option --levels 016 edits runlevels 0, 1, and 6.

QUESTION 91:

CORRECT TEXT

Which process has a PID of 1. Type in the process name?

Answer: init

Explanation: init process has 1 process ID so init is called the parent of all process. You can check the process tree using pstree and using top command PID, memory stats, nice value etc.

QUESTION 92:

CORRECT TEXT

What is the name of the file and location that governs what run level is to be booted to on startup. Give full path and file name

Answer: /etc/inittab

Explanation: The file /etc/inittab contains the default run level as well as run level specific scripts.

id:3:initdefault:

If you haven't specified the run level system boots on run level 9 that is unknown run level.

QUESTION 93:

CORRECT TEXT

You wish to list out in text all the daemons running and stopped on your system for all run levels. Type in the simplest command

Answer: chkconfig --list

Explanation:

chkconfig provides a simple command-line tool for maintaining the /etc/rc[0-6].d directory hierarchy by relieving system administrators of the task of directly manipulating the numerous symbolic links in those directories.

To list the all services running and stopped (status) for all run levels.

chkconfig -list

To list the specific service:

chkconfig --list atd

QUESTION 94:

You need to change the default run-level for a machine. Which file should you edit?

- A. /etc/init.d
- B. /etc/init-table
- C. /etc/inittab
- D. /etc/init

Answer: C

Explanation: The file /etc/inittab contains the default run level as well as run level specific scripts.

id:RUNLEVEL:initdefault:

If you haven't specified the run level system boots on run level 9 that is unknown run level.

QUESTION 95:

A file exists on a server, but has no content. Users cannot submit jobs to an attached

printer. Choose the correct file that must be edited to fix this problem.

- A. /etc/hosts
- B. /etc/hosts.allow
- C. /etc/host.deny
- D. /etc/hosts.lpd
- E. /var/spool/hosts.lpd

Answer: D

Explanation:

The /etc/hosts.lpd file defines which remote systems are permitted to print on the local system.

Only that hosts specified in /etc/hosts.lpd can send the printing job. To solve that problem administrator should add the host name on that file.

QUESTION 96:

Which of the following are valid commands to affect your system's printing?

- A. lpq
- B. lprm
- C. lpstatus
- D. lpr
- E. lpio

Answer: A, B, D

Explanation:

lpr command is used to send the printing job.

lpq command is used to query the printing job

lprm command is used to remove the printing job

QUESTION 97:

Which of the following commands will flush all print jobs on all configured queues of the system?

- A. lprm -a all
- B. lprm -all
- C. lprm -a *
- D. lpflush -all

Answer: A

Explanation:

lprm -a all command is used to flush all print job on all configured queues.

QUESTION 98:

What program do you use to suspend a printer queue?

- A. lpr
- B. lpq
- C. lpc
- D. lpd
- E. lprm

Answer: C

Explanation:

The lpc command is used to examine and control the print server operation. The lpc status command displays the administrative status of a print queue. The lpd program caches status and job information in order to improve performance. The lpc flush command will flush the cached information and cause the server to regenerate it. The lpc enable and lpc disable commands enable or disable spooling to the print queue, and the lpc stop and lpc start commands stop and start printing (or transfers) of jobs in the print queue

QUESTION 99:

Which parameters should appear in a valid /etc/printcap file to allow a local printer queue to point to another machine's print queue? Choose two.

- A. rm
- B. rp
- C. remoteip
- D. netprinter
- E. netip

Answer: A, B

Explanation:

rm à remote machine (hostname) (with rp)
rp à remote printer name (with rm)

QUESTION 100:

What command would cause a print job to be printed next regardless of its current position in the queue?

- A. lpc topq
- B. lpc -t

- C. lpq -t
- D. lpc move
- E. lpq --next

Answer: A

Explanation:

The lpc command is used to examine and control the print server operation. The lpc status command displays the administrative status of a print queue. The lpd program caches status and job information in order to improve performance. The lpc flush command will flush the cached information and cause the server to regenerate it. The lpc enable and lpc disable commands enable or disable spooling to the print queue, and the lpc stop and lpc start commands stop and start printing (or transfers) of jobs in the print queue.

The lpc topq command can be used to put a job (or jobs) at the head of the spool queue. This command is very useful when some job requires priority service. You can select the job by using the job number or the job ID.

QUESTION 101:

Which of the following commands will print the file putty on the printer hplaserj? Choose all that apply.

- A. lpr -P hplaserj -F putty
- B. lpr -Phplaserj putty
- C. lpc printer=hplaserj file=putty
- D. lpr -p hplaserj putty
- E. lpr -P hplaserj putty

Answer: B, E

Explanation: lpr command is used to send the printing job. If printer is not specified then it will send printing job to default printer. To specify the printer name should use the -P option.

Example:

lpr -Pprintername -#numberofcopies filename
-# or -K specify the number of copies.

QUESTION 102:

Which commands will print two copies of the file to the default printer? Choose all that apply.

- A. cat hosts | lpr -#2
- B. lpr -K2 hosts
- C. lpr -P -count 2 hosts

- D. cat hosts > lpr ; cat hosts > lpr
- E. for 1 in 2 lpr hosts

Answer: A, B

Explanation: lpr command is used to send the printing job. If printer is not specified then it will send printing job to default printer. To specify the printer name should use the -P option.

Example:

lpr -Pprintername -#numberofcopies filename
-# or -K specify the number of copies.

QUESTION 103:

What would the following command do?

cat hosts | lpr -#2

- A. Print the file hosts on the default printer two times.
- B. Categorize hosts and print the categorization as job #2.
- C. Output the file hosts to the line printer and assign it to the second printer queue.
- D. Print the hosts file to STDOUT and assign the current print job to printer tray number 2.

Answer: A

Explanation: lpr command is used to send the printing job. If printer is not specified then it will send printing job to default printer. To specify the printer name should use the -P option.

Example:

lpr -Pprintername -#numberofcopies filename
-# or -K specify the number of copies.

QUESTION 104:

You need to print 12 copies of the document foo.txt.
Which of the following commands would you use?

- A. cat foo.txt | lpr -#12
- B. cat foo.txt > lpr -#12
- C. cat foo.txt | lpr -12
- D. cat foo.text > lpr -12

Answer: A

Explanation:

cat command reads the contents of foo.txt and send to print to the default printer twelve copies of same documents.

QUESTION 105:

What command will flush all jobs on all print queues on a Linux system that uses the LPD daemon? Type the command with any options and arguments.

Answer: lprm -a all

Explanation:

lprm -a all command is used to flush all print job on all configured queues.

QUESTION 106:

CORRECT TEXT

What file on a remote host should be configured to allow your host to print to its already functioning printers? Type the full path and name of the file.

Answer: /etc/hosts.lpd

Explanation:

The /etc/hosts.lpd file defines which remote systems are permitted to print on the local system. Only that hosts specified in /etc/hosts.lpd can send the printing job.

QUESTION 107:

The hosts.lpd file provides:

- A. A list of network printer IP addresses.
- B. A listing of printers available on the local network.
- C. A listing of computers that have printer (lpd) daemons running.
- D. A listing of hosts allowed to use printers on the local machine.
- E. A list of hosts on the local network that are not allowed access to printers attached to the local machine.

Answer: D

Explanation:

The /etc/hosts.lpd file defines which remote systems are permitted to print on the local system. Only that hosts specified in /etc/hosts.lpd can send the printing job.

See the output of /etc/hosts.lpd

Station1.example.com

Station2.example.com

Station3.example.com

Only station1, 2 and 3 can send the print job.

QUESTION 108:

What file is used to deny hosts access to a system's printers? Type the filename including full path.

Answer: /etc/hosts.lpd

Explanation:

The /etc/hosts.lpd file defines which remote systems are permitted to print on the local system.

Only that hosts specified in /etc/hosts.lpd can send the printing job.

See the output of /etc/hosts.lpd

Station1.example.com

Station2.example.com

Station3.example.com

Only station1, 2 and 3 can send the print job. Other host can't send the printing job.

QUESTION 109:

Which two commands share the same database for retrieving information?

- A. whatis
- B. whereis
- C. apropos
- D. find
- E. man

Answer: A, C

Explanation:

whatis as well as apropos command used the same database to retrieve the information. Database can update using makewhatis command

QUESTION 110:

What command will show only complete word matches for a search term?

- A. whatis
- B. apropos
- C. locate
- D. find
- E. whereis

Answer: A

Explanation: whatis command will show only the complete word matches for a

search term i.e
whatis ls
See the output
ls (1) - list directory contents
whatis clear
clear (1) - clear the terminal screen

QUESTION 111:

What command will show partial word matches for a search term?

- A. apropos
- B. locate
- C. whereis
- D. whatis
- E. find

Answer: A

Explanation

apropos command show partial word matches for a search.

apropos clear

See the output

clear (1) - clear the terminal screen

clearenv (3) - clear the environment

clearerr [ferror] (3) - check and reset stream status

execstack (8) - tool to set, clear, or query executable stack flag of ELF binaries and shared libraries

feclearexcept [fenv] (3) - C99 floating point rounding and exception handling

klogctl [syslog] (2) - read and/or clear kernel message ring buffer; set

console_loglevel

molecule (1) - draws 3D molecular structures

pam_timestamp_check (8) - check or clear authentication timestamps

syslog (2) - read and/or clear kernel message ring buffer; set console_loglevel

QUESTION 112:

What command is the functional equivalent of the command "man -k searchterm"?

- A. apropos searchterm
- B. whatis searchterm
- C. locate searchterm
- D. find / -name searchterm
- E. None of the selections

Answer: A

Explanation:

apropos command show partial word matches for a search. Same as man -k searchterm.

apropos clear

See the output

clear (1) - clear the terminal screen

clearenv (3) - clear the environment

clearerr [ferror] (3) - check and reset stream status

execstack (8) - tool to set, clear, or query executable stack flag of ELF binaries and shared libraries

feclearexcept [fenv] (3) - C99 floating point rounding and exception handling

klogctl[syslog] (2) - read and/or clear kernel message ring buffer; set

console_loglevel

molecule (1) - draws 3D molecular structures

pam_timestamp_check (8) - check or clear authentication timestamps

syslog (2) - read and/or clear kernel message ring buffer; set console_loglevel

Similar like:

man -k clear

QUESTION 113:

What command is the functional equivalent of the command "man -f searchterm"?

- A. whatis searchterm
- B. apropos searchterm
- C. locate searchterm
- D. find / -name searchterm
- E. None of the selections

Answer: A

Explanation: whatis command will show only the complete word matches for a search term equivalent man -f command

whatis ls

See the output

ls (1) - list directory contents

man -f ls

ls (1) - list directory contents

QUESTION 114:

You want to find the man pages for utilities and tools related to PPP, but you don't know the name of the specific commands. How can you get a list of man pages that contain information about PPP?

- A. whatis ppp

- B. man ppp
- C. apropos ppp
- D. mandb ppp

Answer: C

Explanation:

apropos command show partial word matches for a search. Same as man -k searchterm.

See the output of apropos command

adsl-connect (8) - Shell script to manage a PPPoE link

adsl-setup (8) - Shell script to configure Roaring Penguin PPPoE client

adsl-start (8) - Shell script to bring up a PPPoE link

adsl-status (8) - Shell script to report on status of PPPoE link

adsl-stop (8) - Shell script to shut down a PPPoE link

caplugin (8) - Plugin for pppd (Point-to-Point Protocol daemon)

Devel::PPPort (3pm) - Perl/Pollution/Portability

ibod (1) - ISDN MPPP bandwidth on demand daemon

ifcfg-ppp0 [pppoe] (5) - Configuration file used by adsl-start(8), adsl-stop(8), adsl-status(8) and adsl-connect(8)

ipppd (8) - (ISDN) Point to Point Protocol daemon

pppd (8) - Point-to-Point Protocol Daemon

pppdump (8) - convert PPP record file to readable format

pppoe (8) - user-space PPPoE client

pppoe-relay (8) - user-space PPPoE relay agent

pppoe-server (8) - user-space PPPoE server

pppoe-sniff (8) - examine network for non-standard PPPoE frames

pppstats (8) - print PPP statistics

pppstats [ippstats] (8) - print PPP statistics

ppp-watch (8) - daemon to make PPP interfaces act more like other interfaces

wvdial (1) - PPP dialer with built-in intelligence

QUESTION 115:

CORRECT TEXT

Type in the command that is equivalent to man -k:

Answer: apropos

Explanation:

apropos command show partial word matches for a search. Same as man -k searchterm.

QUESTION 116:

CORRECT TEXT

Type in the command that is equivalent to `man -f`:

Answer: `whatis`

Explanation: `whatis` command will show only the complete word matches for a search term equivalent `man -f` command

`whatis ls`

See the output

`ls (1)` - list directory contents

`man -f ls`

`ls (1)` - list directory contents

QUESTION 117:

You need to find all references in your system documentation to the word "copy". Which of the following will best accomplish this task?

- A. `man copy`
- B. `which copy`
- C. `locate copy`
- D. `apropos copy`
- E. `grep "copy" /usr/man/*`

Answer: D

Explanation:

`apropos` command show partial word matches for a search. Same as `man -k searchterm`.

`apropos copy` it will list all references having word `copy`.

`bcopy (3)` - copy byte sequence

`bcopy [bstring] (3)` - byte string operations

`copysign (3)` - copy sign of a number

`copysignf [copysign] (3)` - copy sign of a number

`copysignl [copysign] (3)` - copy sign of a number

`cp (1)` - copy files and directories

`cpio (1)` - copy files to and from archives

`dd (1)` - convert and copy a file

`File::Copy (3pm)` - Copy files or filehandles

`ginstall [install] (1)` - copy files and set attributes

`intltoolize (8)` - copy intltool related files to software package

`mcopy (1)` - copy MSDOS files to/from Unix

`memccpy (3)` - copy memory area

`memcpy (3)` - copy memory area

`memmove (3)` - copy memory area

`memcpy (3)` - copy memory area

`objcopy (1)` - copy and translate object files

pax (1) - read and write file archives and copy directory hierarchies
rcp (1) - remote file copy
scp (1) - secure copy (remote file copy program)
strcpy (3) - copy a string returning a pointer to its end
strncpy (3) - copy a fixed-size string, returning a pointer to its end
strcpy (3) - copy a string
strncpy [strcpy] (3) - copy a string
tiffcp (1) - copy (and possibly convert) a TIFF file
wcpcpy (3) - copy a wide character string, returning a pointer to its end
wcpncpy (3) - copy a fixed-size string of wide characters, returning a pointer to its end
wcscpy (3) - copy a wide character string
wcsncpy (3) - copy a fixed-size string of wide characters
wmemcpy (3) - copy an array of wide-characters
wmemmove (3) - copy an array of wide-characters
wmemcpy [memcpy] (3) - copy memory area

QUESTION 118:

CORRECT TEXT

Assume that on your system, there are man pages for both the command crontab and the configuration file for crontab. What command would you use to access the man page for the crontab configuration file?

Answer: man 5 crontab

Explanation: Numerical value 5 is for configuration file. 8 for administration command. So, for crontab configuration file use man 5 crontab.

QUESTION 119:

CORRECT TEXT

What section of the Man pages are system administration commands in? Type the numeral of the section:

Answer: 8

Explanation: Numerical value 8 for system administration command and 5 for configuration file.

QUESTION 120:

CORRECT TEXT

What section of the Man pages are system files mentioned in? Type the numeral of the section.

Answer: 5

Explanation: Numerical value 5 is for configuration file. 8 for administration command. So, for crontab configuration file use man 5 crontab.

QUESTION 121:

The directory location /usr/share/doc contains what files?

- A. All documentation created from application source code.
- B. All documentation you wish to share with other users.
- C. Supplemental information about installed packages.
- D. Programs for reading documentation.

Answer: A

Explanation: /usr/share/doc/ directory contains the all documentation file create from the application source code.

QUESTION 122:

CORRECT TEXT

What is the preferred documentation tool of the FSF? Type in the name of the tool only:

Answer: info

Explanation: info is the preferred documentation tool for FSF.

Example: info date

QUESTION 123:

The main collection of Linux usenet newsgroups are found in which usenet hierarchy?

- A. sys.linux
- B. comp.linux
- C. comp.os.linux
- D. comp.sys.linux
- E. comp.opsys.linux

Answer: C

QUESTION 124:

CORRECT TEXT

What Internet based organization is primarily responsible for hosting and

distributing the various Linux HOWTOs? (NOT the URL)

Answer: the linux documentation project

Explanation: The Linux Documentaion Project is primarily responsible for hosting and distributing the various Linux HOWTOs. The official site is www.tldp.org

QUESTION 125:

CORRECT TEXT

You need to access the site for HOWTO's, Guides and mini HOWTO's. Type in the full URL as it would appear in any browser, including the protocol.

Answer: <http://www.linuxdoc.org>

Answer: <http://www.tldp.org>

Explanation: The Linux Documentaion Project is primarily responsible for hosting and distributing the various Linux HOWTOs. The official site is www.tldp.org. As well as Linux Documentation are found in www.linuxdoc.org .

QUESTION 126:

What file is displayed BEFORE users log in for users who log in to the machine locally?

- A. [/etc/issue](#)
- B. [/etc/issue.net](#)
- C. [/etc/motd](#)
- D. [/etc/local.banner](#)

Answer: A

Explanation: The file [/etc/issue](#) is a text file which contains a message or system identification to be printed before the login prompt. And [/etc/issue.net](#) contains a message or syste, identification to be printed before the remote (telnet) login.

QUESTION 127:

CORRECT TEXT

Type in the name of the file including full path that holds contains a daily message viewed by users when they log in?

Answer: [/etc/motd](#)

Explanation: motd (Message Of The Day) contains the daily message and displayed after login.

QUESTION 128:

CORRECT TEXT

Type in the name of file and full path to the file that holds a message for remote users about possible system outages:

Answer: /etc/issue.net

Explanation: The file /etc/issue is a text file which contains a message or system identification to be printed before the login prompt. And /etc/issue.net contains a message or system identification to be printed before the remote (telnet) login.

QUESTION 129:

How can you enable onscreen (non-printing) numbers in a vi session?

- A. :set num
- B. :se nu
- C. :set -o number
- D. :set +o num
- E. None of the choices

Answer: B

Explanation: To enable line numbers on vi editor :set number or :se nu. To remove the line number on vi editor :set nonumber or :se nonu

QUESTION 130:

When starting vi with the file nohup.out, which of the following will enable onscreen numbers?

- A. vi +/set num nohup.out
- B. vi +"se nu" nohup.out
- C. vi /+"set number" nohup.out
- D. vi +":set num" nohup.out
- E. echo "set numb" | vi nohup.out

Answer: B

Explanation: If you want to set the onscreen line number on vi editor while starting the vi use the vi +" se nu" filename where + is like concatenation symbol.

QUESTION 131:

What command with options will cause the redirection symbol (>) to fail to overwrite the contents of an existing file?

- A. set -o noclobber
- B. set +o nooverwrite
- C. export OVERWRITE=no
- D. alias >='!>'
- E. None of the choices

Answer: A

Explanation: Shell can configure through variable, aliases, functions, set, shopt commands.

set -o : Lists all shell options

noclobber option prevent the overwriting the file using > symbol. If status of noclobber is on then it overrides to file using >.

#set -o noclobber : Which brings the noclobber in on state

#set +o noclobber : Which brings the noclobber in off state.

QUESTION 132:

CORRECT TEXT

You wish to execute the ls command but it appears to be aliased. What is the easiest way of execute the original ls command without the alias?

Answer: \ls

Explanation: \ symbol is used to kill the meaning of predefined characters.

Example: echo "Total Amount is \$5" it displays the \$5 because \ removing the meaning of \$ here.

alias ls="clear"

#ls :Clear the screen

#\ls : Previous meaning then alias

QUESTION 133:

What does the following command accomplish?

"export PATH=\$PATH:\$APPLICATIONS"

- A. Changes path to the applications directory.
- B. Updates the path with the value of \$APPLICATIONS.
- C. All NFS users can mount the applications directly.
- D. Updates path with the applications directory.

Answer: B

Explanation: Using the export command, we can export the local variable into the sub-shells.

Example:

```
#X=100
```

```
#bash :Entered into the sub-shell
```

```
#echo $X : not accessing
```

```
#exit : Return back to previous shell
```

```
#export X : Exporting the X variable to sub-shell
```

```
#bash :Entering into the sub-shell
```

```
#echo $X : It display the value of X variable.
```

QUESTION 134:

You've just finished editing a new entry in the /etc/exports file. Which of the following will cause the changes to take effect without interrupting current connected users or rebooting the machine? Choose all that apply.

- A. exportfs -a
- B. /etc/rc.d/init.d/nfs restart
- C. service nfs restart
- D. kill -1 HUP nfs
- E. init 1

Answer: A

Explanation: exportfs command is used to maintain the current table of exported file systems for the NFS.

exportfs -a : Export all shared directories written in /etc/export

exportfs -v : Shows locally shared directories

exportfs -r : Refresh the changes in /etc/export file

expotfs -u : Unshared the exported directories

QUESTION 135:

CORRECT TEXT

After modifying /etc/exports, what must be done to make the modifications available to users? Type the command with any options and arguments.

Answer: exportfs -r

Explanation: exportfs command is used to maintain the current table of exported file systems for the NFS.

exportfs -a : Export all shared directories written in /etc/export

exportfs -v : Shows locally shared directories

exportfs -r : Refresh the changes in /etc/export file
exportfs -u : Unshared the exported directories

QUESTION 136:

CORRECT TEXT

You added /usr/local/bin to your PATH environment variable.
Next you executed the command make, which calls gcc. This failed because gcc couldn't find the executable in /usr/local/bin that it needed. To fix this, you should execute:

_____PATH allowable

Answer: export

Explanation: Using the export command, we can export the local variable into the sub-shells.

Example:

#X=100

#bash :Entered into the sub-shell

#echo \$X : not accessing

#exit : Return back to previous shell

#export X : Exporting the X variable to sub-shell

#bash :Entering into the sub-shell

#echo \$X : It display the value of X variable.

QUESTION 137:

What two files acting together make up the login environment for a user on a default install of Linux?

A. /etc/profile

B. /etc/bashrc

C. /etc/.login

D. ~/.bash_profile

E. /etc/.profile

Answer: A, D

Explanation: profile script file is used to declare the environmental variable as well as to run the program automatically at login time.

/etc/profile : It is a global scripts, when you write in this file it applies to all users

~/.bash_profile : It is user specific file, when you write in this file it applies only to that particular user.

QUESTION 138:

In what file do you change default shell variables for all users?

- A. /etc/bashrc
- B. /etc/profile
- C. ~/.bash_profile
- D. /etc/skel/.bashrc
- E. /etc/skel/.bash_profile

Answer: B

Explanation: profile script file is used to declare the environmental variable as well as to run the program automatically at login time.

/etc/profile : It is a global scripts, when you write in this file it applies to all users

~/.bash_profile : It is user specific file, when you write in this file it applies only to that particular user.

QUESTION 139:

Which two files in a user's home directory are used to customize the bash environment?

- A. bash and .bashrc
- B. bashrc and-bash_conf
- C. bashrc and bashprofile
- D. .bashrc and .bash_profile
- E. bash.conf and .bash_profile

Answer: D

Explanation: user has lots of hidden files in home directory, which is used to modify the user's environment.

Like: ~/.bashrc : User specific alias, function

~/.bash_profile : User specific startup program, variables

~/.bash_history : contains the user's history

~/bash_logout : Executes when user logout from the shell

QUESTION 140:

What BASH environment variable will prevent you from overwriting a file with a ">" or ">>"?

- A. set-o safe
- B. set-o noglob
- C. set-o noclobber

- D. set-o append
- E. set-o nooverwrite

Answer: C

Explanation: Shell can configure through variable, aliases, functions, set, shopt commands.

set -o : Lists all shell options

noclobber option prevent the overriwiting the file using > symbol. If status of noclobber is on then it overrides to file using >.

#set -o noclobber : Which brings the nocobber in on state

#set +o noclobber : Which brings the noclobber in off state.

QUESTION 141:

CORRECT TEXT

You issued the command: export CFLAGS="-march-i586". You can remove this environment variable by using the command:

_____CFLAGS

Answer: unset

Explanation: unset command removes the variables as well as command line functions.

#X=100

#echo \$X

#unset X

QUESTION 142:

Which command allows you to make a shell variable visible to subshells?

- A. export \$VARIABLE
- B. export VARIABLE
- C. set \$VARIABLE
- D. set VARIABLE
- E. env variable

Answer: B

Explanation: Using the export command, we can export the local variable into the sub-shells.

Example:

#X=100

#bash :Entered into the sub-shell

#echo \$X : not accessing

#exit : Return back to previous shell

#export X : Exporting the X variable to sub-shell
#bash :Entered into the sub-shell
#echo \$X : It display the value of X variable.

QUESTION 143:

CORRECT TEXT

You want to make sure all Bash users, when they login, get access to a new program in /opt/bin (not currently in their PATH). To ensure this you would put the command: PATH=\$PATH:/opt/bin; export PATH in what file?

Answer: /etc/profile

Explanation: profile script file is used to declare the environmental variable as well as to run the program automatically at login time called the startup programs.
/etc/profile : It is a global scripts, when you write in this file it applies to all users.
Example: If you declare some variable in this file can access by all users. So if you want to modify the value of environmental variable, you should edit this file. Eg HOME, LANG, SHELL, PATH, PWD, PS1 etc.
~/.bash_profile : It is user specific file, when you write in this file it applies only to that particular user.

QUESTION 144:

What is the purpose of the bash built-in export command?

- A. To allow disks to be mounted remotely.
- B. To run a command as a process in a sub-shell.
- C. To make the command history available to sub-shells.
- D. To setup environment variables for applications.
- E. To share NFS partitions for use by other systems on the network.

Answer: D

Explanation: Using the export command, we can export the local variable into the sub-shells.
Example:
#X=100
#bash :Entered into the sub-shell
#echo \$X : not accessing
#exit : Return back to previous shell
#export X : Exporting the X variable to sub-shell
#bash :Entered into the sub-shell
#echo \$X : It display the value of X variable.

QUESTION 145:

CORRECT TEXT

Where are command line aliases defined for a user? Type the full path and name of the file for the currently logged in user.

Answer: ~/.bashrc

Explanation: user has lots of hidden files in home directory, which is used to modify the user's environment.

Like: ~/.bashrc : User specific alias, function

~/.bash_profile : User specific startup program, variables

~/.bash_history : contains the user's history

~/bash_logout : Executes when user logout from the shell

QUESTION 146:

CORRECT TEXT

A user wishes to modify his Environment variable PATH, What file should you tell him to edit in his home directory. Give filename only, no path.

Answer: .bash_profile

Explanation: user has lots of hidden files in home directory, which is used to modify the user's environment.

Like: ~/.bashrc : User specific alias, function

~/.bash_profile : User specific startup program, variables

~/.bash_history : contains the user's history

~/bash_logout : Executes when user logout from the shell

QUESTION 147:

CORRECT TEXT

Within a script you need to create a loop. Following the for variable list, the statements to be looped are found between the keywords _____ and done.

Answer: do

Explanation: Here is the simple example of for and while loop

For.sh

#!/bin/bash

clear

echo -n "Enter Several Words"

read words

for word in \$words

do

```
echo "Current Word is: $word"
done
while.sh
#!/bin/bash
ans="yes"
while [ $ans = "yes" ]
do
echo -n "Enter filename to read"
read file
cat $file
echo -n "Do you want to read another file ?"
read ans
done
```

QUESTION 148:

Which of the following will run a file named myscript every 23 minutes past midnight every two hours?

- A. 23 0-23/2 * * * /myscript
- B. 23 */0-23 * * * /myscript
- C. 23 @2 * * * /myscript
- D. 11 2/0-23 * * * /myscript

Answer: A

Explanation:

cron executes the system job in different time interval.

Syntax for cron is:

Minute Hour day of Month Month Day of Week Command

Minute can be 0-59

Hour can be 0-23

Day of Month 1-31

Month 1-12

Day of Week 0-7 Where 0 or 7 is Sunday.

QUESTION 149:

CORRECT TEXT

Within a script you need to create a loop. Following the for variable in list, the statements to be looped are found between the keywords ____ and done.

Answer: do

Explanation: do done defines the scope of loop to be executed when condition becomes true.

Here is the simple example of for and while loop

For.sh

```
#!/bin/bash
```

```
clear
```

```
echo -n "Enter Several Words"
```

```
read words
```

```
for word in $words
```

```
do
```

```
echo "Current Word is: $word"
```

```
done
```

while.sh

```
#!/bin/bash
```

```
ans="yes"
```

```
while [ $ans = "yes" ]
```

```
do
```

```
echo -n "Enter filename to read"
```

```
read file
```

```
cat $file
```

```
echo -n "Do you want to read another file ?"
```

```
read ans
```

```
done
```

QUESTION 150:

CORRECT TEXT

You are running a Red Hat machine. You have added a 2nd NIC to your machine and rebooted it. The card is detected in the BIOS but is not configured along with the eth0 interface upon network start. A file must be created to allow this interface to function. Type the full path and name of the file.

Answer: /etc/sysconfig/network-scripts/ifcfg-eth1

Explanation: eth0 is the first ethernet card name and eth1 is the second ethernet card name. Interface configuration filename is

/etc/sysconfig/network-scripts/ifcfg-eth? Containing the following directives

DEVICE=eth?

ONBOOT=yes | no

BOOTPROTO=static || dhcp

IPADDR=x.x.x.x

NETMASK=x.x.x.x

GATEWAY=x.x.x.x

QUESTION 151:

CORRECT TEXT

What command will tell you which groups you belong to?

Answer: groups

Explanation: groups command displays the belonging group name.

Example: groups : displays the group name you belongs to

groups user1 : Displays the groups name in which user1 belongs to

QUESTION 152:

CORRECT TEXT

What file would you edit to make the current user's vi session options always take effect? Type the full path and filename.

Answer: ~/.vimrc

Answer: ~/.exrc

Explanation: ~/.vimrc or ~/.exrc are called vi configuration file. when you open the vi editor it opens with the configuration configured in configuration file.

Example: when you set the line numbers using :set number, it sets only for current session. If you want always the line number you need to write in configuration file.

Example:

```
#vi .vimrc
```

```
:set number
```

```
:set ignorecase
```

```
#vi filename
```

When you try to open file using vi editor it tries to open by .vimrc configuration, if file not found then tries to open with configuration of .exrc

QUESTION 153:

You want to change the aging information in the /etc/shadow file.

What is the best utility to use to do this?

- A. vi
- B. emacs
- C. usermod
- D. modinfo
- E. chage

Answer: E

Explanation: Here is the sample entry of /etc/shadow

```
User1:!!:13322:0:99999:7:::
```

This file contains users password as well as password aging policy. Better editing this file use chage command.

chage -l username : List the password aging policy eg minimum days to change password, maximum days to use same password, password expire days, number of days to give warning before password expiration etc.

chage -M 20 username : Sets the maximum number of days to user same password.

#chage -m 10 username : Sets minimum number of days to use same password.

#chage -W 7 username : Sets the warning starts days before password expire.

QUESTION 154:

You've been reviewing your security checklist and one of the items calls for reviewing the /etc/passwd file. You cat the file and notice that, while most users have an x in the second column, a few have a 14 character string in the second column. What action, if any, should you take?

- A. No action. The users with an x have their accounts locked.
- B. Run pwconv to convert the unix passwords to shadow passwords.
- C. Use the passwd program to give the users with the hashed passwords new passwords.
- D. Use the passwd program to give the users with the x new passwords.
- E. No action. Linux knows how to handle the situation and allow user logins.

Answer: B

Explanation: By default password stores in /etc/shadow by encrypting using MD5 tool. So when you read /etc/passwd it shows like following entry:

User1:x:500:500:/home/user1:/bin/bash

Where x represents that user's password is in /etc/shadow file.

To store the user information as well as user's password in /etc/passwd

#pwunconv

To store users password in /etc/shadow

#pwconv

QUESTION 155:

Your /etc/passwd file appears to have approximately 1/2 shadow passwords and 1/2 standard unix encrypted passwords. What utility would you most likely run again to fix this?

- A. pwconv
- B. passconvert
- C. useradd -conv
- D. pwhash
- E. passwd -fix

Answer: A

Explanation: By default password stores in /etc/shadow by encrypting using MD5 tool. So when you read /etc/passwd it shows like following entry:

User1:x:500:500:/home/user1:/bin/bash

Where x represents that user's password is in /etc/shadow file.

To store the user information as well as user's password in /etc/passwd

#pwunconv

To store users password in /etc/shadow

#pwconv

QUESTION 156:

Where are the default settings for the useradd command kept?

- A. /etc/default/useradd
- B. /etc/sysconfig/useradd.cfg
- C. /etc/.useradd
- D. /etc/defaults/useradd
- E. /etc/login.defs

Answer: A

Explanation: useradd command reads the default settings from /etc/default/useradd as well as from /etc/login.defs file. Like some default settings are password never expire, never account expire, normal user's ID starts from 500 etc. If you want to change default settings just modify these file.

QUESTION 157:

CORRECT TEXT

What command with switches allows you to set the defaults for the useradd command? Type the command with any options and arguments.

Answer: useradd -D

Explanation: When useradd command invokes without -D option, the useradd command creates a new user account using the values specified on the command line and the default values from the system.

QUESTION 158:

CORRECT TEXT

You wish to add the user bill to the system including his home directory. Type in the simplest command to do this including switches:

Answer: useradd -m bill

Explanation: -m option is used to create the user's home directory if already doesn't exists.

QUESTION 159:

CORRECT TEXT

You wish to remove the user stef from the system, including his home directories. Type in the simplest command to do this:

Answer: userdel -r stef

Explanation: userdel command is used to remove the user from the system. Where -r option is used to remove the user with home directory.

userdel username : Deletes the user from system but preserves the user's home directory.

#userdel -r username : Deletes the user with home directory.

QUESTION 160:

CORRECT TEXT

User rick has been suspended from your company and you wish to lock his account to stop anyone using it. Type in the simplest command to do this:

Answer: usermod rick -L

Answer: passwd -L rick

Explanation: We can lock the user account either usermod or passwd command.

#usermod -L username : Which locks the user account

#usermod -U username : which unlocaks the user account

QUESTION 161:

CORRECT TEXT

User bill has been exiled to the marketing department who has a group name mktg. You now wish to change the primary group for the user bill to the mktg group. Type in the simplest command to do this:

Answer: usermod -g mktg bill

Explanation: usermod command is used to modify the user's account.

#usermod -g groupname username : Make user primarily belongs to group

#usermod -G groupname username : Make user Suppliemntarily belongs to group

#usermod -d directory username : Set the home directory

#usermod -s shell username :Change the login shell
#usermod -L username : Locks the user account
#usermod -U username : Unlocks the user account

QUESTION 162:

CORRECT TEXT

What command will insert a single "!" symbol in from of the encrypted password in the system's shadow file? Type the command with any options and arguments:

Answer: usermod -L

Answer: passwd -l

Explanation: when user account lock it insert ! symbol in form of encrypted password in /etc/shadow. User account can lock using

#usermod -L username

or

#passwd -l username

QUESTION 163:

You just installed a new system, but before you create any new users you want to ensure they have a subdirectory bin/ in their home directory. To ensure this directory is automatically created each time you add a new user, in what subdirectory should you create the directory?

Answer: /etc/skel

Explanation: /etc/skel directory is called the template directory. When new user will create into system it automatically copies all the contents of /etc/skel into users home directory.

QUESTION 164:

CORRECT TEXT

You just installed a new system, but before you create any new users you want to ensure they have a subdirectory bin/ in their home directory. To ensure this directory is automatically created each time you add a new user, in what subdirectory should you create the directory?

Answer: /etc/skel

Explanation: /etc/skel directory is called the template directory. When new user will create into system it automatically copies all the contents of /etc/skel into users home directory.

QUESTION 165:

CORRECT TEXT

Where should you put the .pinerc file so that all new users get it as part of their initial creation? Type the full path of the directory.

Answer: /etc/skel

Explanation: /etc/skel directory is called the template directory. When new user will create into system it automatically copies all the contents of /etc/skel into users home directory.

If you create welcome file in /etc/skel it will copy into user's home directory while creating the users.

QUESTION 166:

CORRECT TEXT

Type in the full path and name of the global environment and startup program configuration file; this file typically contains the PATH, umask and ulimit system wide settings.

Answer: /etc/profile

Explanation: /etc/profile is used to declare the global environmental variable as well as startup program. When declare into this file it applies to all users. And user specific variable and startup program is declared in ~/.bash_profile.

QUESTION 167:

You are working in a graphical environment and trying to configure PPP, but are having problems. You know that PPP uses the local2 facility for logging. To better watch what's going on, you decide to open an Xconsole session and sent all local2 messages there. How should you configure /etc/syslog.conf to show you all messages sent from PPP?

- A. local2.* /dev/console
- B. local2.* /dev/xconsole
- C. *.local2 /dev/xconsole
- D. *.local2 *

Answer: A

Explanation: /etc/syslog.conf file the main configuration of syslogd and klogd service. In this file can specify the facility and priority.

Facility.priority

Example:

Mail.info : which means info priority of mail facility.

QUESTION 168:

CORRECT TEXT

What is the full path and file name of the file that contains the configuration files for system logging? Type in full path and file name.

Answer: /etc/syslog.conf

Explanation: /etc/syslog.conf file the main configuration of syslogd and klogd service. In this file can specify the facility and priority.

Facility.priority

Example:

Mail.info : which means info priority of mail facility.

QUESTION 169:

CORRECT TEXT

Type in the file and full path to the configuration file for the Sytem logging daemons:

Answer: /etc/syslog.conf

Explanation: /etc/syslog.conf file the main configuration of syslogd and klogd service. In this file can specify the facility and priority.

Facility.priority

Example:

Mail.info : which means info priority of mail facility.

QUESTION 170:

CORRECT TEXT

You want to display a list of all last logged in users. The file /var/log/wtmp exists.

Which command would you use?

Answer: last

Explanation: last command displays the login and reboot history. /var/log/wtmp file maintains this record but file in binary mode. last command reads the record from this file.

QUESTION 171:

CORRECT TEXT

The last command functionality needs what log file to be present to operate properly? Type the full path and name of the file:

Answer: /var/log/wtmp

Explanation: /var/log/wtmp file contains all users logged in and system reboot record since this file is created. Names of users and tty's can be given, in which case last will show only those entries matching the arguments.

QUESTION 172:

CORRECT TEXT

You are working an evening shift and want to look at which jobs are pending for the at command.

What command would you use?

Answer: atq

Explanation:

at command is used to set the job to execute later. Example:

at now + 5 minutes

at> poweroff

at>ctrlr+d

It will set the job to execute after 5 minutes to poweroff the system.

atq lists all jobs pending to execute

atrm is used to remove the at queues.

QUESTION 173:

Which daemon or service can be configured as a non-root user?

- A. cron
- B. ntp
- C. lpr
- D. nmbd
- E. slocate

Answer: A

Explanation: cron is used to execute recurring jobs. Cron searches /var/spool/cron for crontab files which are named after accounts in/etc/passwd;crontabs found are loaded into memory. Cron also searches for /etc/crontab and the files in the /etc/cron.d directory, which are in a different format.

QUESTION 174:

Which two files are responsible for allowing users to execute cron jobs?

- A. /etc/cron.allow
- B. /var/spool/cron.allow
- C. /var/spool/cron.allow
- D. /etc/cron.deny

Answer: A, D

Explanation: If the file cron.allow exists and your username appears in it, you may use or access the cron scheduling. If the cron.allow file does not exist and the file cron.deny does, you must not be listed in cron.deny to use cron schedule. If neither file exists the default behaviour is not allow all users to schedule jobs, with cron.

QUESTION 175:

CORRECT TEXT

The correct crontab entry in the minutes column to create a command in cron that runs every two minutes would be _____.

Answer: */2

Explanation: To schedule the job with cron you need to create in following syntax:
Minute Hour Day Of Month Month Day of Week Command

Where * represents every example:

`* */5 * * * echo "hello" >/dev/tty9`

Which means on every 5 hours of all day execute the echo hello and display on terminal 9.

QUESTION 176:

To increase system security, it is often desirable to run daemons for system services with non-root user ids. Which one of the following services can be run as a non-root user?

- A. inetd
- B. named
- C. rlogind
- D. crond
- E. telnetd

Answer: D

Explanation: cron is used to execute recurring jobs. Cron searches /var/spool/cron for crontab files which are named after accounts in /etc/passwd; crontabs found are loaded into memory. Cron also searches for /etc/crontab and the files in the /etc/cron.d directory, which are in a different format. Where crond is the daemon of cron schedule. There crond should be in running state to execute the cron job.

QUESTION 177:

How many cron fields are there for specifying the time to execute a cron job?

- A. 1
- B. 3
- C. 4
- D. 5
- E. 6

Answer: D

Explanation: To schedule the job with cron you need to create in following syntax:

Minute Hour Day Of Month Month Day of Week Command

Where * means every example:

`* */5 * * * echo "hello" >/dev/tty9`

Which means on every 5 hours of all day execute the echo hello and display on terminal 9.

QUESTION 178:

Which crontab entry could be used to set the system time at regular intervals?

- A. `10 * * * date dt$24`
- B. `10 * * * settime dt$24`
- C. `10 * * * date<ntp1.digex.net`
- D. `10 * * * * /usr/sbin/runcron date <ntp1.digex.net`
- E. `10 * * * * /usr/sbin/ntpdate ntp1.digex.net> /dev/null2>&1`

Answer: E

Explanation: Syntax of adding the job in cron is:

Minute Hour Day Of Month Month Day of Week Command

Where * means every example:

`* */5 * * * echo "hello" >/dev/tty9`

Which means on every 5 hours of all day execute the echo hello and display on terminal 9.

ntpdate command is used to set date and time by pooling the Network Time Protocol (NTP) Server given as the server arguments to determine the correct time.

`10 * * * * /usr/sbin/ntpdate ntp1.digex.net> /dev/null2>&1` : This line executes the ntpdate command on every 10 seconds to synchronize the date and time with NTP server ntp1.digex.net and sends the standard output and error into /dev/null.

QUESTION 179:

The correct crontab entry to execute the script chklog once per hour between 3 p.m. and 5 p.m. on Monday and Thursday each week is:

- A. 0 3,4,5 * * 2,5 chklog
- B. 0 3,4,5 * * 1,4 chklog
- C. 0 15,16,17 * * 1,4 chklog
- D. 0 15,16,17 1,4 * * chklog
- E. * 15,16,17 * * 1,4 chklog

Answer: C

Explanation : Time can specify using *, / and , etc wildcard.

Example: 3,4,5 means in 3, 4 and 5, */20 on every 20, * on every etc

So Answer C means between 15, 16, 17 on every day of month, every months on

Monday and Thursday should execute the chklog. Remember the time format :

Minute Hour Day Of Month Month Day of Week Command

Minute can be: 0-59

Hour can be: 0-23

Day of Month can be : 1-31

Month can be : 1-12

Day of Week can be : 0-7 where 0 or 7 is Sunday.

QUESTION 180:

CORRECT TEXT

What file or utility is used by normal users to configure the cron daemon? Type in the name of the tool:

Answer: crontab

Explanation: crontab command maintains files for individual users.

Example: crontab filename : Adds the file into cron schedule

#crontab -l : List all scheduled files using crontab

#crontab -r : Removes the cron schedules

#crontab -e : Edits the cron schedules

QUESTION 181:

CORRECT TEXT

You wish to list the contents of your crontab. Type in the simplest command to do this:

Answer: crontab -l

Explanation: crontab command maintains files for individual users.

Example: crontab filename : Adds the file into cron schedule

#crontab -l : List all scheduled files using crontab

#crontab -r : Removes the cron schedules

#crontab -e : Edits the cron schedules

QUESTION 182:

CORRECT TEXT

You wish to make changes to your crontab entry. Type in the simplest command to make this change:

Answer: crontab -e

Explanation: crontab command maintains files for individual users.

Example: crontab filename : Adds the file into cron schedule

#crontab -l : List all scheduled files using crontab

#crontab -r : Removes the cron schedules

#crontab -e : Edits the cron schedules

QUESTION 183:

CORRECT TEXT

You have a job scheduled to run at 16:30 using the AT scheduler.

When you type atq it displays the following information

```
[root@localhost root]# atq
```

```
2 2003-03-14 16:00 a root
```

```
[root@localhost root]#
```

Type in the command to remove only this job:

Answer: atrm 2

Explanation:

at command is used to set the job to execute later. Example:

at now + 5 minutes

at> poweroff

at>ctrlr+d

It will set the job to execute after 5 minutes to poweroff the system.

atq lists all jobs pending to execute

atrm is used to remove the pending at job, it requires the job id number.

```
#atrm 2
```

QUESTION 184:

CORRECT TEXT

What command will show pending jobs that will be executed once on a given date and time? Type just the command to accomplish this:

Answer: atq

Explanation:

at command is used to set the job to execute later. Example:

at now + 5 minutes

at> poweroff

at>ctrlr+d

It will set the job to execute after 5 minutes to poweroff the system.

atq lists all jobs pending to execute

QUESTION 185:

Which backup method resets the archive bit? Select all that apply.

- A. Full
- B. Incremental
- C. Differential
- D. Copy
- E. DirTree

Answer: A, B

Explanation: Backup methods are incremental and full. Full backup copies all contents and incremental backup backs up the contents modified after full backup.

Here is the example of Full Backup:

#dump -0u -f /dev/sda /dev/hda5 : Which backs up the full backup of /dev/hda5 into first SCSI disk.

QUESTION 186:

CORRECT TEXT

What command with options will show you the contents with associated pathnames of an archive file named archive.tar.gz? The file must not be unpacked with the command string. Type the full command string to accomplish this.

Answer: tar -tzvf archive.tar.gz

Answer: tar tzvf archive.tar.gz

Answer: tar zxvf archive.tar.gz

Answer: tar -zxvf archive.tar.gz

Explanation: files are archived as well as compressed using gzip tool. To unpack the compressed and archived file : tar -zxvf filename

Where -z option is used to compress or uncompress using zip or gunzip tool.

-x : Extract the archive file

-t : Test the archived file

v: Verbose

If file is compressed by bzip2 command you should use j option instead of z.

QUESTION 187:

CORRECT TEXT

What command will most effectively send a list of certain files from a directory to the tar or cpio command? Type just the command name.

Answer: ls

Explanation: ls command list all directory contents. Output of ls command can send to tar or cpio.

Example: ls | tar -cvf mytar.tar *

QUESTION 188:

CORRECT TEXT

You wish to archive and compress all the files in your home directory starting with the word projects into a file called myprojects.tar.gz. You are currently in your home directory. Type in the command that would do this:

Answer: tar -czf myprojects.tar.gz projects*

Answer: tar czf myprojects.tar.gz projects*

Answer: tar -zcf myprojects.tar.gz projects*

Answer: tar zcf myprojects.tar.gz projects*

Explanation: tar is the standard archiving tool in redhat enterprise linux used to manage the archive files.

#tar -cvf mytar.tar file or files or wildcard : which creates the archive files of mytar.tar

#tar -tvf mytar.tar : Which test the archived file

#tar -xvf mytar.tar : Which extract the mytar.tar file

tar may also compress the archived files but using the gzip or bzip2 tools are very good to compress. Using z for zip and j for bzip2 option is used to compress the archive file with tar command.

QUESTION 189:

CORRECT TEXT

You have a tarball called myprojects.tar.gz and you wish to view the permissions and ownership of its contents without unpacking it. Type in the simplest command to do this:

Answer: tar -tzvf myprojects.tar.gz

Answer: tar tvzf myprojects.tar.gz

Answer: tar zvtf myprojects.tar.gz

Answer: tar ztvf myprojects.tar.gz

Explanation: tar is the standard archiving tool in redhat enterprise linux used to manage the archive files.

#tar -cvf mytar.tar file or files or wildcard : which creates the archive files of mytar.tar

#tar -tvf mytar.tar : Which test the archived file

#tar -xvf mytar.tar : Which extract the mytar.tar file

tar may also compressed the archived files but using the gzip or bzip2 tools are very good to compress. Using z for zip and j for bzip2 option is used to compress the archive file with tar command.

QUESTION 190:

CORRECT TEXT

You have just downloaded an application called rdesktop from the internet. The file downloaded is named rdesktop.tar.gz. Type in the simplest command to decompress and untar this file into the current directory:

Answer: tar -zxf rdesktop.tar.gz

Answer: tar zxf rdesktop.tar.gz

Explanation: tar is the standard archiving tool in redhat enterprise linux used to manage the archive files.

#tar -cvf mytar.tar file or files or wildcard : which creates the archive files of mytar.tar

#tar -tvf mytar.tar : Which test the archived file

#tar -xvf mytar.tar : Which extract the mytar.tar file

tar may also compressed the archived files but using the gzip or bzip2 tools are very good to compress. Using z for zip and j for bzip2 option is used to compress the archive file with tar command.

QUESTION 191:

Which file system should never be backed up and therefore never have to be

restored?

- A. ufs
- B. usr
- C. tmp
- D. home
- E. swap

Answer: E

Explanation: swap also called the virtual memory, which means using disk space as RAM. We never take the backup of swap filesystem and never restore also.

QUESTION 192:

CORRECT TEXT

What one filesystem should you never restore (and therefore not backup): _____.

Answer: swap

Explanation: swap also called the virtual memory, which means using disk space as RAM. We never take the backup of swap filesystem and never restore also.

QUESTION 193:

On a default Linux system, what file system type does the dump command act upon?

- A. Ext2
- B. UFS
- C. JFS
- D. XFS
- E. ReiserFS

Answer: A

Explanation: dump examines files on an ext2/3 filesystem and determines which files need to be backedup. These files are copied to the given disk, tape, other storage medium for safe keeping. By default dump command ext2/ext3 filesystem does the dump act upon.

QUESTION 194:

CORRECT TEXT

What is a filesystem type the dump utility can work with?

Answer: ext2/ext3

Explanation: dump examines files on an ext2/3 filesystem and determines which files need to be backedup. These files are copied to the given disk, tape, other storage medium for safe keeping. By default dump command ext2/ext3 filesystem does the dump act upon.

QUESTION 195:

Which directory tree is ordinarily the least likely to be backup or restore?

- A. /tmp
- B. /var
- C. /proc
- D. /usr
- E. /usr

Answer: C

Explanation: /proc is called the virtual filesystem, created automatically at boot time containing the information of running kernel. So no need to take backup.

QUESTION 196:

Which backup method will require the minimum tapes to restore?

- A. Full
- B. Incremental
- C. Differential
- D. Copy
- E. DirTree

Answer: A

Explanation: To restore the data from tapes at least one full backup is required.
#restore -rf devicename

QUESTION 197:

CORRECT TEXT

You use the public NTP server time.nist.gov to make sure your system clock is accurate before using it to adjust your hardware clock. Complete the following command to accomplish this:

_____ time.nist.gov

Answer: ntpdate

Explanation: ntpdate sets the local date and time by polling the Network Time Protocol server given as the server arguments to determine the correct time. It must be run as a root on the local host.

QUESTION 198:

CORRECT TEXT

To slave your NTP daemon to an external source, you need to modify the _____ variable in your /etc/ntp.conf file.

Answer: server

Explanation: needs to modify the server parameter in file to specify the master NTP server.

QUESTION 199:

CORRECT TEXT

NTP is used to synchronize the system ____ with a central system resource.

Answer: clock

Explanation: ntp sets the clock by pooling the NTP server given as the server arguments.

QUESTION 200:

What protocol will allow you to keep accurate time on your hosts?

- A. ntp
- B. nntp
- C. ncftp
- D. inn
- E. ntime

Answer: A

Explanation: ntp protocol sets the local date and time from other server given as the server arguments to determine the correct time. It must be run as a root on the local host.

QUESTION 201:

CORRECT TEXT

A user complains that his laptop shows the wrong time when it is not connected to the network.

What command must the superuser run to adjust the laptop's clock without entering in BIOS?

Answer: date

Explanation: date command is used to set or display the system date and time.
#date -s "new date and time" : It sets the new date and time into system

QUESTION 202:

To learn more about the management or ownership of a website, what's the best utility to use?

- A. tracert
- B. traceroute
- C. whois
- D. ping
- E. telnet

Answer: C

Explanation: The whois service of web site shows more information regarding the web site i.e owner of site, contact information. There are lots of sites provides the whois service i.e www.dnsstuff.com

QUESTION 203:

Which protocol is used for the majority of the ping command's actions?

- A. ICMP
- B. UDP
- C. TCP
- D. NDP
- E. NCP

Answer: A

Explanation:
ICMP works at the Network layer and is used by IP for many different services. ICMP is a management protocol and messaging service provider for IP. Its messages are carried as IP datagrams. RFC 1256 is an annex to ICMP, which affords hosts' extended capability in discovering routes to gateways. Ping checks the network connectivity using the ICMP protocol.

QUESTION 204:

Which protocol is used by ping?

- A. TCP
- B. UDP
- C. SMB
- D. ICMP
- E. OSPF

Answer: D

Explanation:

ICMP works at the Network layer and is used by IP for many different services.

ICMP is a management protocol and messaging service provider for IP. Its messages are carried as IP datagrams. RFC 1256 is an annex to ICMP, which affords hosts' extended capability in discovering routes to gateways. Ping checks the network connectivity using the ICMP protocol.

QUESTION 205:

If you suspect that a gateway machine on your network has failed but you are unsure which machine, which command will help locate the problem?

- A. ps
- B. netstat
- C. nslookup
- D. ifconfig
- E. traceroute

Answer: E

Explanation: traceroute command shows the local and remote routing path to reach on destination.

#traceroute www.yahoo.com

QUESTION 206:

In the following output, which is representative of the host performing gateway functions?

```
Destination Gateway Genmask Flags Metric Ref Use Iface
10.3.3.0 192.168.1.1 255.255.255.255 UGH 0 0 0 eth0
192.168.1.0 * 255.255.255.0 U 0 0 0 eth0
192.168.77.0 * 255.255.255.0 U 0 0 0 vmnet1
127.0.0.0 * 255.0.0.0 U 0 0 0 lo
default 192.168.1.1 0.0.0.0 UG 0 0 0 eth0
```

- A. The default gateway is on 192.168.77.0 network

- B. The current host is the also the default gateway
- C. Its eth0 interface is incorrectly configured
- D. The 192.168.1.1 is the default gateway

Answer: B

QUESTION 207:

CORRECT TEXT

You build and configured a bastion host to act as a router between two internal networks. Both eth0 and eth1 can see hosts on their respective networks, but the hosts on each network cannot see any hosts on the other network. After verifying that the hosts have the correct gateway route, you decide the bastion host does not have IP forwarding turned on. Which command would you type to check this cat the file /proc/sys/net/ipv4/ _____ to ensure it has a 1?

Answer: ip_forward

Explanation: Router forwards the packets from one network to another network. If you would like to make the Linux system as a router, you need to enable the IP forwarding. To enable for current session

```
#echo "1" >/proc/sys/net/ipv4
```

To enable automatically at boot time

```
#vi /etc/sysctl.conf
```

```
net.ipv4.ip_forward=1
```

Where 1 means enable and 0 means disable the ip forwarding.

QUESTION 208:

Identify the statement that would create a default route using a gateway of 192.168.1.1

- A. netstat-add default gw
- B. route default 192.168.1.1
- C. ip route default 192.168.1.1
- D. route add default gw 192.168.1.1
- E. ifconfig default gw 192.168.1.1 eth0

Answer: D

Explanation: route command is used to manipulate the routing table in Linux.

```
#route -n or netstat -rn : Shows the routing table
```

```
#route add -net remote_network netmask gw gateway : which sets the gateway for remote network.
```

```
#route add default gw gateway : Which sets the default gateway for all network
```

QUESTION 209:

CORRECT TEXT

What command will most effectively track a network path problem?

Answer: traceroute

Explanation: traceroute command shows the local and remote routing path to reach on destination.

#traceroute www.Certkiller.com : Which shows the local and remote routing path to reach to Certkiller.com

QUESTION 210:

CORRECT TEXT

What program will determine basic connectivity to a remote host? Type just the name of the program.

Answer: ping

Explanation: ping command is used to check the basic connectivity to a remote host. Ping command uses the ICMP protocol to communicate.

ping remotehost

ping -c 5 remotehost

QUESTION 211:

Which of the following options will speed up traceroute for distant network queries?

- A. -n
- B. -p
- C. -0
- D. -t
- E. -q

Answer: A

QUESTION 212:

Which ports are used for FTP data and control? Choose Two.

- A. 20
- B. 23
- C. 22
- D. 21
- E. 25

Answer: A, D

Explanation: FTP (File Transfer Protocol) uses 20 and 21 ports. Where 21 for authentication and 20 is for data transfer.
You can check the uses port in /etc/services file.

QUESTION 213:

Which of the following IP address ranges are considered private, according to RFC 1918? Choose all that apply.

- A. 10.0.0.0 - 10.255.255.255
- B. 192.168.0.0 - 192.168.255.255
- C. 172.16.0.0 - 172.31.255.255
- D. 191.168.16.0 - 192.168.31.255
- E. 172.16.0.0 - 172.16.255.255

Answer: A, B, C

Explanation: Private IP Address on different class
Class A 10.0.0.0 through 10.255.255.255
Class B 172.16.0.0 through 172.31.255.255
Class C 192.168.0.0 through 192.168.255.255

QUESTION 214:

What is the binary conversion of the IP address 192.168.1.10?

- A. 11000000.10101000.00000001.00001010
- B. 01101010.11000100.10101000.00000001
- C. 00000001.00001010.11000000.10101000
- D. 10101000.00000001.00001010.11000000
- E. None of the choices

Answer: A

Explanation:
Example of Binary Conversion To understand IP addressing, you must first understand binary. Binary is a computer language that is represented by a bit value of 0 or 1. A 32-bit binary address would resemble 10101010101010101010101010101010. Those 32 bits can be grouped into 4 octets, or 10101010 10101010 10101010 10101010, for conversion to decimal format. When the bit value is 1, the bit is considered to be on and you can calculate its binary value depending on its placement within the binary octet. When the bit value is 0, the bit is off and has no corresponding binary value. Figure 4.1 displays the binary value and the calculated decimal value of each bit within an octet.

Notice that the binary value increases exponentially.

Figure 4.1. A list of binary and decimal conversion values.

Binary								
Value	27	26	25	24	23	22	21	20
Decimal								
Value	128	64	32	16	8	4	2	1

Converting Binary to Decimal By using the value calculated for each bit you can easily convert to decimal format. Line up the binary octet with the decimal value that was calculated in Figure 4.1. To calculate the total decimal value of each octet, you would add up the binary value of each bit that is on (1).

The example in Table 4.1 uses binary octet 00000000.

Table 4.1. Example #1 of a Binary-to-Decimal Conversion

Bit								
Value	0	0	0	0	0	0	0	0
Decimal								
Value	128	64	32	16	8	4	2	1

In this case, all the bit values are off (0), so there is no corresponding decimal value. The IP address octet value is also 0.

Table 4.2 uses binary octet 00010001.

Table 4.2. Example #2 of a Binary-to-Decimal Conversion

Bit								
Value	0	0	0	1	0	0	0	1
Decimal								
Value	128	64	32	16	8	4	2	1

In this example, the fourth and last bit values are 1. Add the decimal values to get the total decimal value of that octet. That is, the total decimal value = 17 (16 + 1).

Table 4.3 uses binary octet 11111111.

Table 4.3. Example #3 of a Binary-to-Decimal Conversion

Bit								
Value	1	1	1	1	1	1	1	1
Decimal								
Value	128	64	32	16	8	4	2	1

In Table 4.3, the total decimal value = 255 (128 + 64 + 32 + 16 + 8 + 4 + 2 + 1).

In this case, all the bit values are on (1), so all the decimal values are added together to calculate the IP address octet. The IP address octet value is 255.

Now, you can convert a 32-bit binary address into a dotted decimal address. In this example the binary address is 10101010 01010101 11000011 00111100. Start with the first octet 10110000. Table 4.4 shows the conversion of 10101010 from binary to decimal value.

Table 4.4. Binary-to-Decimal Conversion of 10101010

Bit								
Value	1	0	1	1	0	0	0	0
Decimal								
Value	128	64	32	16	8	4	2	1

128 32 16

In Table 4.4, the total decimal value = 176 (128 + 32 + 16).

The second octet is 01010101. Table 4.5 shows the conversion of 01010101 from binary to decimal value.

Table 4.5. Binary-to-Decimal Conversion of 01010101

Bit								
Value	0	1	0	1	0	1	0	1
Decimal								
Value	128	64	32	16	8	4	2	1
	64	16	4	1				

In Table 4.5, the IP octet value = 85 (64 + 16 + 4 + 1).

The third octet is 11000011. Table 4.6 shows the conversion of 11000011 from binary to decimal value.

Table 4.6. Binary-to-Decimal Conversion of 11000011

Bit								
Value	1	1	0	0	0	0	1	1
Decimal								
Value	128	64	32	16	8	4	2	1
	128	64					2	1

In Table 4.6, the total decimal value = 195 (128 + 64 + 2 + 1)

The fourth and final octet is 00111100. Table 4.7 shows the conversion of 00111100 from binary to decimal value.

Table 4.7. Binary-to-Decimal Conversion of 00111100

Bit								
Value	0	0	1	1	1	1	0	0
Decimal								
Value	128	64	32	16	8	4	2	1
			32	16	8	4		

In Table 4.7, the total decimal value = 60 (32 + 16 + 8 + 4).

Based on these calculations, the IP address in dotted decimal format is 176.85.195.60.

QUESTION 215:

Your server logfile shows repeated connections to TCP port 143, what service is being accessed?

- A. smtp
- B. imap
- C. pop3
- D. pop2
- E. nmbd

Answer: B

Explanation: Services uses the TCP/UDP port to communication with client. Imap uses 143, pop3 uses 110 pop2 uses 109, smtp uses 25 etc port.

QUESTION 216:

Which of the following IP networks does RFC1918 reserve for use on private intranets?
(Choose two)

- A. 10.0.0.0
- B. 224.0.0.0
- C. 199.14.0.0
- D. 172.152.0.0
- E. 192.168.0.0

Answer: A, E

Explanation: Private IP Address on different class

Class A 10.0.0.0 through 10.255.255.255

Class B 172.16.0.0 through 172.31.255.255

Class C 192.168.0.0 through 192.168.255.255

QUESTION 217:

The _____ is used by the local host to determine which hosts are on the local subnet, and which hosts are on remote networks.

- A. DNS
- B. ARP
- C. gateway
- D. netmask
- E. routing protocol

Answer: D

Subnet MasksSub-networks

(subnets) enable you to break a large network of IP addresses down into smaller, manageable address ranges. A smaller address range means fewer hosts on a network. Each subnet becomes a separate broadcast domain. All the devices that are in the same broadcast domain receive all broadcasts. Think if it were possible to have all 16,777,214 Class A network hosts sharing a broadcast domain and receiving all broadcasts. That would be a huge amount of traffic. Subnets enable you to break this large network into smaller address ranges. In this case, smaller is better. A subnet mask is used to identify which part of an IP address is the network portion. Like the IP address itself, a subnet mask consists of 32 bits. The network portion is represented by all 1s.

The default subnet masks for Class A, Class B, and Class C networks are as follows:

- * Class A 255.0.0.0 (11111111 00000000 00000000 00000000)
- * Class B 255.255.0.0 (11111111 11111111 00000000 00000000)
- * Class C 255.255.255.0 (11111111 11111111 11111111 00000000)

QUESTION 218:

Which two of the following Class B IPv4 networks are reserved by IANA for private address assignment and private routing? (Choose two)

- A. 128.0.0.0
- B. 169.16.0.0
- C. 169.254.0.0
- D. 172.16.0.0
- E. 172.20.0.0

Answer: C, D

Explanation The address 192.168.x.x and 172.16.x.x are well known internal use addresses. 172.16 is a Class B IP number. 169.254 is an class B internal use IP number This IP range is also uses by Microsoft, then known as APIPA addresses when no DHCP address can be provided.

QUESTION 219:

CORRECT TEXT

With a Class C address, and a subnet mask of 255.255.255.0, how many host addresses are assignable?

Answer: 254

Explanation: Class C addresses uses 24 bits for network and 8 bits for host address. So the number of host in one network is $2^8 - 2 = 254$

QUESTION 220:

CORRECT TEXT

Your IP address is 1.2.3.3. Which command would add a default gateway using the network 1.2.3.4?

Answer: route add default gw 1.2.3.4

Explanation: route command is used to manipulate the routing table in Linux.

#route -n or netstat -rn : Shows the routing table

#route add -net remote_network netmask gw gateway : which sets the gateway for remote network.

#route add default gw gateway : Which sets the default gateway for all network

QUESTION 221:

CORRECT TEXT

Your IP address is 170.35.13.28 and your network mask is 255.255.255.192. What host IP address is NOT a part of your local subnet?

- A. 170.35.13.33
- B. 170.35.13.88
- C. 170.35.13.62
- D. 170.35.13.55

Type in just the letter of the answer:

Answer: B

Explanation: Subnetmask is 255.255.255.192

Network ID is : 256-192=64

64 host can belongs to one subnet but usable hosts are 62. First Subnet is 1-64 So B is correct answer.

QUESTION 222:

There is any entry like the following in the file /etc/ftpusers:

#root

Will root be allowed to connect via ftp to this host?

- A. Yes
- B. No
- C. It depends

Answer: A

Explanation:

Explanation can be found in man ftpusers:

"NAME

ftpusers - list of users that may not log in via the FTP daemon

DESCRIPTION

The text file ftpusers contains a list of users that may not log in using the File Transfer Protocol (FTP) server daemon. This file is used not merely for system administration purposes but for improving security within a TCP/IP networked environment. It will typically contain a list of the users that either have no business using ftp or have too many privileges to be allowed to log in through the FTP server daemon. Such users usually include root, daemon, bin, uucp, and news. If your FTP server daemon doesn't use ftpusers then it is suggested that you read its documentation to find out how to block access for certain users.

Washington University FTP server Daemon (wuftpd) and Professional FTP Daemon (proftpd) are known to make use of ftpusers.

FORMAT

The format of ftpusers is very simple. There is one account name (or user name) per line. Lines starting with a # are ignored."

QUESTION 223:

CORRECT TEXT

To find the port used by a particular known service, you would look in what file?
Type the full path and name of the file.

Answer: /etc/services

Explanation: /etc/services file contains the port of services. You can find out the details of protocol, port number of services.

tcpmux 1/tcp

tcpmux 1/udp

rje 5/tcp

rje 5/udp

echo 7/tcp

echo 7/udp

QUESTION 224:

What system file contains definitions of well known ports, their associated services and protocols?

A. /etc/services

B. /etc/sysconfig/network-scripts

C. /etc/services.conf

D. /etc/inet/hosts

E. None of the choices

Answer: A

Explanation: /etc/services file contains the port of services. You can find out the details of protocol, port number of services.

tcpmux 1/tcp

tcpmux 1/udp

rje 5/tcp

rje 5/udp

echo 7/tcp

echo 7/udp

QUESTION 225:

Select from the list below the daemons that are present on a standard Linux server to support routing. Choose all that apply.

- A. gated
- B. ripd
- C. routed
- D. ospfd
- E. bgpd

Answer: B, C, D, E

Explanation: zebra provides services to support different routing protocol. Ripd is the daemon if RIP, ospfd is the service of ospf, bgpd is the service of BGP routing protocol.

QUESTION 226:

What is a well-known service that binds port 25 and is it required on all hosts?

- A. SNMP and it should be turned off if not needed.
- B. SMTP and it is a required service.
- C. SMTP and it is only required on MX hosts.
- D. SLPD and it is required if you run LDAP services.
- E. SSHD and it is required for secure logins.

Answer: C

Explanation: Simple Mail Transport Protocol is used to send mail to mail server, which uses the 25 TCP port number. While configuring the DNS needs to specify the mail exchanger of domain using MX record.

@ IN MX 5 mail.example.com.

@ IN MX 10 mail1.example.com.

Where mail.example.com is the primary mail exchanger of the domain and mail1.example.com is the secondary mail exchanger of domain.

QUESTION 227:

CORRECT TEXT

What command will display the active connections and Unix domain sockets for a running Linux machine with networking configured? Type just the command to accomplish this.

Answer: netstat

Explanation: netstat command prints the network connections, routing tables, statistics, masquerade connections and multicast memberships.

#netstat -a : Shows both listening and non-listening sockets.

#netstat -l : Shows only listening sockets.

#netstat -p : Shows the PID and name of the program to which each socket belongs.

QUESTION 228:

Suppose that the command netstat-a hangs for a long time without producing output.

You might suspect:

- A. A problem with NFS
- B. A problem with DNS.
- C. A problem with NIS.
- D. A problem with routing.
- E. That the netstat daemon has crashed.

Answer: E

Expanation: netstat command prints the network connections, routing tables, statistics, masquerade connections and multicast memberships.

#netstat -a : Shows both listening and non-listening sockets.

#netstat -l : Shows only listening sockets.

#netstat -p : Shows the PID and name of the program to which each socket belongs.

E is the best answer.

QUESTION 229:

CORRECT TEXT

You need to view the hardware address and IP address information for all of your configured and active interfaces. Type the simplest command string that will accomplish this.

Answer: ifconfig

Explanation: ifconfig command shows the information about the network devices ie. hardware address, ip address etc. By default ifconfig command shows only the enabled devices and ifconfig -a shows enabled as well as disabled devices.

QUESTION 230:

CORRECT TEXT

To immediately stop a DDOS attack from 10.1.1.128, what can you do? Type the command with the necessary options and arguments.

Answer: route add 10.1.1.128 lo

Explanation: route command helps to manipulate the routing table in Linux.

#route -n : Shows the routing table

#route add -net remote_network netmask gw next_hop or connected_device_name

It adds the gateway for remote network. When adding the loopback in routing table it denies the DDOS attack on local machine.

QUESTION 231:

Your machine has two working NIC's with proper addresses. You want to split your network into two new subnets. What single command will accomplish this?

- A. ifconfig
- B. route
- C. default
- D. netstat
- E. None of the choices

Answer: A

Explanation: Using ifconfig command can display the information of NIC card as well as can assign IP address on interface.

#ifconfig eth0 10.4.4.100 netmask 255.255.255.0 : Which assigns the IP Address 10.4.4.100 with netmask 255.255.255.0 into first ethernet card.

QUESTION 232:

Your server has two fully functional NIC's with correct IP configuration. The server is not forwarding traffic between the NIC's. Which command string will set the cards to forward properly?

- A. setparam 1 > /proc/sys/net/ipv4/ip_autoconfig
- B. echo 1 > /proc/sys/net/ipv4/ip_forward
- C. set \$=1 /proc/sys/net/ipv4/route
- D. cat \$1 > /proc/sys/net/ethernet
- E. vi +/1 /proc/sys/net/unix/max_dgram_qlen

Answer: B

Explanation: IP Forwarding features enable the packets between networks. To use the linux system as a router box, needs to enable the IP forwarding.

/proc is called the virtual filesystem containing the information of running kernel.

To modify the parameter of kernel in running state needs to modify from /proc.

#echo "1" >/proc/sys/net/ipv4/ip_forward : Which enables the IP Forwarding for current session. To enable automatically at next reboot also modify the parameter in /etc/sysctl.conf

net.ipv4.ip_forward=1

QUESTION 233:

You have a Linux system routing 3 networks through 3 separate NICs and are having trouble with your IP forwarding. What file would you check to ensure that

IP forwarding is enabled?

- A. /etc/defaultrouter
- B. /proc/net/tcp
- C. /proc/sys/net/ipv4/ip_forward
- D. /var/log/messages

Answer: C

Explanation: IP Forwarding features enable the packets between networks. To use the linux system as a router box, needs to enable the IP forwarding.

/proc is called the virtual filesystem containing the information of running kernel.

To modify the parameter of kernel in running state needs to modify from /proc.

#echo "1" >/proc/sys/net/ipv4/ip_forward : Which enables the IP Forwarding for current session. To enable automatically at next reboot also modify the parameter in /etc/sysctl.conf

net.ipv4.ip_forward=1

QUESTION 234:

Your machine's IP address used to function, but it's only got the localhost "lo" entry now. What three client-mode commands could you possibly use to get a new DHCP address?

- A. dhcpd
- B. ipconfig
- C. dhclient
- D. pump
- E. dhcpcd

Answer: C, D, E

Explanation: dhclient is the DHCP client command, which sends the request to DHCP server for IP Address.

QUESTION 235:

CORRECT TEXT

In what file can you configure your name server resolution queries to use the localhost first? Type the full path and name of the file.

Answer: /etc/nsswitch.conf

Explanation: nsswitch.conf called the system databases and name service switch configuration file. This specify the order of query. Example When you try to access the computer via name first it sends request to /etc/hosts file then only dns.

hosts: files dns : You can change the order if you want.
Similalry When user try to login on NIS or LDAP client machine, it tires to
authenticate from local machine then only to NIS server.
Passwd: files nis ldap

QUESTION 236:

CORRECT TEXT

Which local system networking file binds a hostname to an IP address? Type the full path and name of the file.

Answer: /etc/hosts

Explanation: /etc/hosts file bind a hostname into IP Address. This is a host file so needs to write in each and every host. So recommended only for small network. Where DNS is the central database no need to maps in each and every machine.

Example:

192.168.1.1 station1.example.com station1

QUESTION 237:

CORRECT TEXT

To change your Ethernet interface eth0 to the IP address 10.4.4.100 with a default class C subnet mask, type the full command string to accomplish this.

Answer: ifconfig eth0 10.4.4.100 netmask 255.255.255.0

Explanation: ifconfig eth0 10.4.4.100 netmask 255.255.255.0

Alternative correct answer: ifconfig eth0 10.4.4.100 netmask 255.255.255.0 up

With the option up - you set these inferface active.

QUESTION 238:

What is the command most often used for configuring network interfaces?

Answer: ifconfig

Explanation: Using ifconfig command can display the information of NIC card as well as can assign IP address on interface.

#ifconfig eth0 10.4.4.100 netmask 255.255.255.0 : Which assings the IP Address 10.4.4.100 with netmask 255.255.255.0 into first ethernet card.

QUESTION 239:

CORRECT TEXT

You wish to restart the network daemon on a Redhat Server. Type in the command

and any arguments that to accomplish this without using any absolutes pathnames:

Answer: service network restart

Explanation: network daemon controls the network services on machine. When starting the network service it reads configuration from /etc/sysconfig/network as well as interface configuration files also.

QUESTION 240:

CORRECT TEXT

You wish to change you network settings permanently using a text/graphical tool. Type in the command to start this tool:

Answer: netconfig

Explanation: netconfig is a tool use to configuration network settings. Example: Assigning IP Addresses, Netmask, Gateway, DNS servers etc.

QUESTION 241:

CORRECT TEXT

Type in the name of the file including path of the static host name to IP address configuration file:

Answer: /etc/hosts

Explanation: /etc/hosts file bind a hostname into IP Address. This is a host file so needs to write in each and every host. So recommended only for small network. Where DNS is the central database no need to maps in each and every machine. Example:
192.168.0.254 server1.example.com server1

QUESTION 242:

What command could you use to confirm function of a ppp connection before establishing it?

- A. minicom
- B. hyperterminal
- C. setserial
- D. modemset
- E. None of the choices

Answer: A

Explanation: minicom is a communication program which somewhat resembles the shareware program TELIX but is free with source code.

To run minicom

#minicom

To setup

#minicom -s

QUESTION 243:

Select all of the protocols that are supported by the Linux implementation of ppp.

A. chap

B. mschap

C. pap

D. spap

E. eap

Answer: A, B, C

Explanation:

PAP PAP is the less secure of the two methods. Passwords are sent in clear text, and PAP is

only performed upon the initial link establishment. When the PPP link is first established, the

remote node sends the username and password back to the sending router until authentication

is acknowledged. That's it.

CHAP CHAP is used at the initial startup of a link and at periodic checkups on the link to

make sure the router is still communicating with the same host.

After PPP finishes its initial phase, the local router sends a challenge request to the remote

device. The remote device sends a value calculated using a one-way hash function called MD5.

The local router checks this hash value to make sure it matches. If the values don't match, the

link is immediately terminated.

QUESTION 244:

What ppp option governs how long an interrupted connection will remain down before it attempts to reconnect?

A. holddown

B. holdoff

C. inactive

- D. delay
- E. wait

Answer: B

QUESTION 245:

When using the PPP daemon make a connection, what option is set to configure it to use hardware flow control?

- A. crtscts
- B. rsync
- C. nsync
- D. connect

Answer: A

QUESTION 246:

When using pppd which authentication protocol is the most secure?

- A. clear text
- B. PAP
- C. CHAP
- D. LAP

Answer: C

Explanation:

PAP PAP is the less secure of the two methods. Passwords are sent in clear text, and PAP is only performed upon the initial link establishment. When the PPP link is first established, the

remote node sends the username and password back to the sending router until authentication

is acknowledged. That's it.

CHAP CHAP is used at the initial startup of a link and at periodic checkups on the link to make sure the router is still communicating with the same host.

After PPP finishes its initial phase, the local router sends a challenge request to the remote device. The remote device sends a value calculated using a one-way hash function called MD5.

The local router checks this hash value to make sure it matches. If the values don't match, the

link is immediately terminated.

QUESTION 247:

According to the PPP HOWTO which piece of software could help you test a modem?

- A. chat
- B. dhcpd
- C. minicom
- D. Hylafax
- E. netconfig

Answer: C

Explanation: minicom is a communication program which somewhat resembles the shareware program TELIX but is free with source code.

To run minicom
#minicom

QUESTION 248:

When using /etc/ppp/peers/* files, which of the following is true:

- A. The /etc/ppp/options should be empty.
- B. Any user can run pppd from the command line.
- C. The dial-on-demand option cannot be used.
- D. You must use chap authentication.

Answer: A

QUESTION 249:

CORRECT TEXT

What command would help you test if your ppp connection was functional? Type just the command name.

Answer: minicom

Explanation: minicom is a communication program which somewhat resembles the shareware program TELIX but is free with source code.

To run minicom
#minicom

QUESTION 250:

CORRECT TEXT

What is the exact, case-sensitive option that governs flow-control for the ppp daemon?

Answer: crtscts

QUESTION 251:

To disable telnet service on a system, which action should you take?

- A. Put NONE in /etc/telnet.allow
- B. Remove the appropriate telnet init script.
- C. Put a line 'ALL:ALL' in /etc/hosts.deny
- D. Comment the telnet entry in /etc/inittab
- E. Comment the telnet entry in /etc/inetd.conf

Answer: E

Explanation: inetd called the super server, will load a network program based upon a request from the network. The inetd.conf file tells inetd which ports to listen to and what server to start for each port.

Edit the inetd.conf file vi /etc/inetd.conf and disable services like telnet, ftp, exec, talk, ntalk imap pop2, pop3 etc

QUESTION 252:

On a default install of a Linux server, regardless of the distribution version, what are the easiest methods to disable telnet, but not uninstall or remove the service? Choose two.

- A. Comment telnet out of the /etc/inetd.conf file
- B. Delete the /etc/rc.d/init.d/telnet file
- C. Rename all SXXtelnet links in the /etc/rc or /etc/rc.d directories
- D. Run "chmod 554 /etc/xinetd.d/telnet"
- E. Nothing, it's not enabled by default

Answer: A, E

Explanation: inetd called the super server, will load a network program based upon a request from the network. The inetd.conf file tells inetd which ports to listen to and what server to start for each port.

Edit the inetd.conf file vi /etc/inetd.conf and disable services like telnet, ftp, exec, talk, ntalk imap pop2, pop3 etc

When you comment on service it disables the services as well as telnet by default not enabled.

QUESTION 253:

Your DNS server needs to be configured for speed and security. Choose the best

answer.

- A. Disable inetd, run named standalone, only allow tcp on ports 25 and 53
- B. Disable inetd, run named standalone, only allow tcp on ports 25 and 110
- C. Enable inetd, run named as an inetd service, only allow tcp on ports 25 and 53
- D. Disable inetd, run named as a standalone on the apache server.

Answer: A

Explanation: inetd called the super server, will load a network program based upon a request from the network. The inetd.conf file tells inetd which ports to listen to and what server to start for each port. So run the named service standalone using service servicename start|restart. Named service uses the 53 ports and tcp, udp protocol.

QUESTION 254:

Which file is responsible for configuring the inet daemon?

- A. /etc/inetd.conf
- B. /etc/xinetd.conf
- C. /etc/tcpd.conf
- D. /etc/inet.conf

Answer: A

Explanation: inetd called the super server, will load a network program based upon a request from the network. The inetd.conf file tells inetd which ports to listen to and what server to start for each port.

Edit the inetd.conf file vi /etc/inetd.conf and disable services like telnet, ftp, exec, talk, ntalk imap pop2, pop3 etc

QUESTION 255:

You decide to use xinetd instead of inetd.

What must be done in order to properly configure xinetd?

- A. You must create a new configuration file for xinetd.
- B. You must add xinetd to /etc/services.
- C. You must add xinetd support to your tcpwrappers configuration files.
- D. Nothing, xinetd uses the same configuration files as inetd.

Answer: A

Explanation:

So the correct answer should be 'A', or even better yet: Execute the following command :

```
"itox -daemon_dir /usr/sbin/tcpd < inetd.conf > xinetd.conf
```

Incorrect: D

You actually do have to create a new configuration file for xinitd as the configuration file formats differ between inetd and xinetd. Luckily, there is a command to do this for you.

QUESTION 256:

You have replaced inetd with xinetd.

What must be done after installing to ensure that your machine will work correctly?

- A. You must add a symbolic link from inetd.conf to xinetd.conf.
- B. You don't have to do anything because they are compatible.
- C. You must create a new configuration file for xinetd.
- D. You must run xinetd-configure first.

Answer: C

Explanation:

'inetd' and 'xinetd' use differently named and formatted configuration files.

QUESTION 257:

CORRECT TEXT

Converting from the inetd to xinetd services requires populating entries in what file, including the full path and name?

Answer: /etc/xinetd.conf

Explanation:

/etc/xinetd.conf is the configuration file for xinetd service and all transient daemons are located in /etc/xinetd.d.

QUESTION 258:

CORRECT TEXT

What is the command to check the syntax of your /etc/inetd.conf?

Answer: tcpdchk

Explanation: tcpdchk examines your tcp wrappers configuration and reports all potential and real problem it can find. The program examines the tcpd access control files and compares the entries in these files against entries in the inetd or tld network configuration files.

QUESTION 259:

CORRECT TEXT

What command can you use to determine the users connected to a Linux ftp server?
Type just the command to accomplish this.

Answer: ftpwho

Explanation: ftpwho command shows process information for all active proftpd connections and a count of all connected users off of each server. Proftpd sessions spawned from inetd are counted separately from those created by a master proftpd standalone server.

QUESTION 260:

CORRECT TEXT

What is the file that contains the settings and conversion parameters for the ftp server? Type in the name of the file only:

Answer: ftpconversions

Explanation: /etc/ftpconversions file contains instructions that permit you to compress files on demand before the transfer.

QUESTION 261:

What configuration file is used for settings and conversion parameters for the ftp daemon?

- A. ftpusers
- B. ftpconvert
- C. ftpconversions
- D. in.ftpd
- E. ftpdefaults

Answer: C

Explanation: /etc/ftpconversions file contains instructions that permit you to compress files on demand before the transfer.

QUESTION 262:

CORRECT TEXT

What file is used to define a list of users that may NOT login to via the ftp daemon?
Type just the name of the file.

Answer: ftpusers

Explanation: /etc/ftpusers file listing users to be disallowed ftp login privileges. Each ftpusers entry is a single line of username

QUESTION 263:

You want a secure and fast DNS server that must also be quickly accessible remotely.

You should:

- A. Reject all udp packets.
- B. Reject all icmp packets.
- C. Reject all icmp untrusted-host packets.
- D. Disable inetd, run ssh and named as standalone daemons.
- E. Use tcpwrappers to only allow connections to ports 22 and 53.

Answer: D, E

Explanation: inetd called the super server, will load a network program based upon a request from the network. The inetd.conf file tells inetd which ports to listen to and what server to start for each port. So run the named service standalone using service servicename start|restart. Named service uses the 53 ports and tcp, udp protocol.

QUESTION 264:

What file must you create in your home directory in order to enable mail forwarding?

- A. .redirect
- B. .forward
- C. .plan
- D. .mail
- E. None of the choices

Answer: B

Explanation: Setting up .forward files is particularly useful in situations where you have more than one account on ACS systems or your account exists on more than one mail server and you want to direct all your mail to one account on one server. Place identical .forward files in all your accounts except for the account in which you intend to read mail.

Example:

```
#vi .forward
user1@example.com
```

QUESTION 265:

CORRECT TEXT

What command with options and arguments will display the mail servers for lpi.org?

Answer: dig lpi.org mx

Answer: dig lpi.org MX

Explanation:

dig (domain information groper) is a flexible tool for interrogating DNS name servers. It performs DNS lookups and displays the answers that are returned from the name server(s) that were queried. Most DNS administrators use dig to troubleshoot DNS problems because of its flexibility, ease of use and clarity of output. Other lookup tools tend to have less functionality than dig.

A typical invocation of dig looks like:

dig @server name type

QUESTION 266:

In what file are the mail aliases kept for Sendmail? (Provide the complete path)

- A. /etc/aliases
- B. /etc/mailaliases
- C. /etc/sendmail.aliases
- D. /etc/sendmail/aliases
- E. /var/spool/mail/aliases

Answer: A

Explanation:

The /etc/aliases file contains the required aliases for the sendmail command. Do not change these defaults, as they are required by the system. The file is formatted as a series of lines in the form:

name:name_1,name_2,name_3,...

The name: is the name of the alias, and the name_n are the aliases for that name.

Lines beginning with white space are continuation lines. Lines beginning with a # (pound sign) are comments.

Aliasing occurs only on local names. System-wide aliases are used to redirect mail.

For example, if you receive mail at three different systems, you can use the /etc/aliases file to redirect your mail to one of the systems. As an individual user, you can also specify aliases in your .mailrc file.

Aliases can be defined to send mail to a distribution list. For example, you can send mail to all of the members of a project by sending mail to a single name.

The sender of a message is not included when the sendmail command expands an

alias address. For example, if amy sends a message to alias D998 and she is defined as a member of that alias, the sendmail command does not send a copy of the message to amy.

The /etc/aliases file is a raw data file; the actual aliasing information placed into a binary format in the /etc/aliasesDB/DB.dir and /etc/aliasesDB/DB.pag files by using the newaliases command. The newaliases command must be executed each time the aliases file is modified.

QUESTION 267:

What directory by default contains the delivered mail for each user?

- A. ~/mail/
- B. /usr/mail/
- C. /var/mail/
- D. /var/mail/spool/
- E. /var/spool/mail/

Answer: E

Explanation: /var/spool/mail is the default mail spool directory. Where you will find the username file containing the spooled mails.

QUESTION 268:

To avoid spammers using your mail server to relay their messages, you need to _____.

- A. Disable the relay control in /etc/aliases
- B. Set up a ruleset for this in /etc/sendmail.cf
- C. Set up relay control in your DNS's MX record.
- D. Recompile sendmail with the -NORELAY flag.

Answer: B

Explanation:

The /etc/sendmail.cf configuration file contains the configuration information for the sendmail command. Information contained in this file includes such items as the host name and domain, and the sendmail rule sets.

The /etc/sendmail.cf file:

1. Stores information about the type of mailer programs running.
2. Defines how the sendmail command rewrites addresses in messages.
3. Defines how the sendmail command operates in the following environments:
 1. Local mail delivery
 2. Local area network delivery using TCP/IP
 3. Remote delivery using Basic Utilities Network (BNU).

QUESTION 269:

You are running an email server configured with the default settings.
In which directory will you found the delivered mail for the user foo?

- A. /var/spool/mail
- B. /home/foo/mail
- C. /var/mail/spool
- D. /var/users/mail

Answer: A

Explanation: /var/spool/mail is the default mail spoolin directory. you will find a file named foo in /var/mail/spool containing spool mails of foo.

QUESTION 270:

CORRECT TEXT

What commands with any options, will cause sendmail to recognize newly added aliases while it's running?

Answer: sendmail -bi

Answer: newaliases

Explanation:

The /etc/aliases file contains the required aliases for the sendmail command. Do not change these defaults, as they are required by the system. The file is formatted as a series of lines in the form:

name:name_1,name_2,name_3,...

The name: is the name of the alias, and the name_n are the aliases for that name.

Lines beginning with white space are continuation lines. Lines beginning with a # (pound sign) are comments.

Aliasing occurs only on local names. System-wide aliases are used to redirect mail.

For example, if you receive mail at three different systems, you can use the /etc/aliases file to redirect your mail to one of the systems. As an individual user, you can also specify aliases in your .mailrc file.

Aliases can be defined to send mail to a distribution list. For example, you can send mail to all of the members of a project by sending mail to a single name.

The sender of a message is not included when the sendmail command expands an alias address. For example, if amy sends a message to alias D998 and she is defined as a member of that alias, the sendmail command does not send a copy of the message to amy.

The /etc/aliases file is a raw data file; the actual aliasing information is placed into a binary format in the /etc/aliasesDB/DB.dir and /etc/aliasesDB/DB.pag files by using

the newaliases command. The newaliases command must be executed each time the aliases file is modified.

QUESTION 271:

CORRECT TEXT

In what directory does undelivered remote mail get stored in? Type the full path and name of the file.

Answer: /var/spool/mqueue

Explanation: /var/spool/mqueue directory contains the remote undelivered mails.

QUESTION 272:

CORRECT TEXT

Undelivered mail for local system users is stored in what directory? Type the full path of the directory.

Answer: /var/spool/mail/username

Explanation: /var/spool/mail is the default mail spoolin directory. Where you will find the username file containing the spooled mails.

QUESTION 273:

You are performing an onsite security inspection of division of your company. On an Apache server, you want to determine what files are needed and which can be removed from the /etc/httpd folder.

Which of the following are possibly valid Apache configuration files? Choose all that apply:

- A. httpd.conf
- B. apached.conf
- C. srm.conf
- D. access.conf
- E. in.http.conf

Answer: A, C, D

Explanation:

Apache's configuration files reside in the directory /etc/httpd. For historical reasons that no longer apply, Apache has three configuration files:

access.conf

Specifies what hosts and users are allowed access to what documents and services

httpd.conf

Specifies options that govern the operation of the httpd daemon

srm.conf

Specifies how your server's documents and organized and formatted

QUESTION 274:

Which of the following files typically are used to configure Apache? (Choose two)

- A. srm.conf
- B. www.conf
- C. http.boot
- D. httpd.conf
- E. apache.conf

Answer: A, D

Explanation:

Specifies what hosts and users are allowed access to what documents and services

httpd.conf

Specifies options that govern the operation of the httpd daemon

srm.conf

Specifies how your server's documents and organized and formatted

QUESTION 275:

You have a standard Apache web server installation and want to make it respond to requests on port 8088. To do this, what configuration file do you need to change?

- A. None. This is the default port.
- B. /etc/httpd/apache.conf
- C. /etc/httpd/ports.conf
- D. /etc/httpd/httpd.conf
- E. /etc/httpd/access.conf

Answer: D

Explanation:

The httpd.conf file is the main configuration file for the Apache web server. A lot options exist, and it's important to read the documentation that comes with Apache for more information on different settings and parameters. The following configuration example is a minimal working configuration file for Apache, with SSL support. Also, it's important to note that we only comment the parameters that relate to security and optimization, and leave all the others to your own research.

Edit the httpd.conf file, vi /etc/httpd/conf/httpd.conf and add/change:

```
### Section 1: Global Environment # ServerType standalone ServerRoot
```

```
"/etc/httpd" PidFile /var/run/httpd.pid ResourceConfig /dev/null AccessConfig
```

```
/dev/null Timeout 300 KeepAlive On MaxKeepAliveRequests 0
KeepAliveTimeout 15 MinSpareServers 16 MaxSpareServers 64 StartServers
16 MaxClients 512 MaxRequestsPerChild 100000 ### Section 2: 'Main' server
configuration # Port 80 <IfDefine SSL> Listen 80 Listen 443 </IfDefine> User
www Group www ServerAdmin admin@openna.com ServerName
www.openna.com DocumentRoot "/home/httpd/ona" <Directory /> Options
None AllowOverride None Order deny,allow Deny from all </Directory>

SSLVerifyClient none SSLVerifyDepth 10 SSLOptions +ExportCertData
+StrictRequire SetEnvIf User-Agent ".*MSIE.*" nokeepalive
This tells httpd.conf file to set itself up for this particular configuration setup with:
```

ServerType standalone

The option ServerType specifies how Apache should run on the system. You can run it from the super-server inetd, or as standalone daemon. It's highly recommended to run Apache in standalone type for better performance and speed.

ServerRoot "/etc/httpd"

The option ServerRoot specifies the directory in which the configuration files of the Apache server lives. It allows Apache to know where it can find its configuration files when it starts.

PidFile/var/run/httpd.pid

The option PidFile specifies the location where the server will record the process id of the daemon when it starts. This option is only required when you configure Apache in standalone mode.

ResourceConfig/dev/null

The option ResourceConfig specifies the location of the old srm.conf file that Apache read after it finished reading the httpd.conf file. When you set the location to /dev/null, Apache allows you to include the content of this file in httpd.conf file, and in this manner, you have just one file that handles all your configuration parameters for simplicity.

AccessConfig/dev/null

The option AccessConfig specifies the location of the old access.conf file that Apache read after it finished reading the srm.conf file. When you set the location to /dev/null, Apache allows you to include the content of this file in httpd.conf file, and in this manner, you have just one file that handles all your configuration parameters for simplicity.

Timeout 300

The option Timeout specifies the amount of time Apache will wait for a GET, POST, PUT request and ACKs on transmissions. You can safely leave this option on its default values.

KeepAlive On

The option KeepAlive, if set to On, specifies enabling persistent connections on this web server. For better performance, it's recommended to set this option to On, and allow more than one request per connection.

MaxKeepAliveRequests 0

The option MaxKeepAliveRequests specifies the number of requests allowed per connection when the KeepAlive option above is set to On. When the value of this option is set to 0 then unlimited requests are allowed on the server. For server performance, it's recommended to allow unlimited requests.

KeepAliveTimeout 15

The option KeepAliveTimeout specifies how much time, in seconds, Apache will wait for a subsequent request before closing the connection. The value of 15 seconds is a good average for server performance.

MinSpareServers 16

The option MinSpareServers specifies the minimum number of idle child server processes for Apache, which is not handling a request. This is an important tuning parameter regarding the performance of the Apache web server. For high load operation, a value of 16 is recommended by various benchmarks on the Internet.

MaxSpareServers 64

The option MaxSpareServers specifies the maximum number of idle child server processes for Apache, which is not handling a request. This is also an important tuning parameter regarding the performance of the Apache web server. For high load operation, a value of 64 is recommended by various benchmarks on the Internet.

StartServers 16

The option StartServers specifies the number of child server processes that will be created by Apache on start-up. This is, again, an important tuning parameter regarding the performance of the Apache web server. For high load operation, a value of 16 is recommended by various benchmarks on the Internet.

MaxClients 512

The option MaxClients specifies the number of simultaneous requests that can be supported by Apache. This too is an important tuning parameter regarding the performance of the Apache web server. For high load operation, a value of 512 is recommended by various benchmarks on the Internet.

MaxRequestsPerChild 100000

The option MaxRequestsPerChild specifies the number of requests that an individual child server process will handle. This too is an important tuning parameter regarding the performance of the Apache web server.

User www

The option User specifies the UID that Apache server will run as. It's important to create a new user that has minimal access to the system, and functions just for the purpose of running the web server daemon.

Group www

The option Group specifies the GID the Apache server will run as. It's important to create a new group that has minimal access to the system and functions just for the purpose of running the web server daemon.

DirectoryIndex index.htm index.html index.php index.php3 default.html index.cgi

The option DirectoryIndex specifies the files to use by Apache as a pre-written HTML directory index. In other words, if Apache can't find the default index page to display, it'll try the next entry in this parameter, if available. To improve performance of your web server it's recommended to list the most used default index pages of your web site first.

Include conf/mmap.conf

The option Include specifies the location of other files that you can include from within the server configuration files httpd.conf. In our case, we include the mmap.conf file located under /etc/httpd/confdirectory. This file mmap.conf maps files into memory for faster serving. See the section on Optimizing Apache for more information.

HostnameLookups Off

The option HostnameLookups, if set to Off, specifies the disabling of DNS lookups. It's recommended to set this option to Off in order to save the network traffic time, and to improve the performance of your Apache web server

If you want to run the httpd service on different port, just change on listen parameter.

QUESTION 276:

CORRECT TEXT

What file is used in recent apache distributions to configure the service? Type the full path and name of the file.

Answer: /etc/apache/httpd.conf

Answer: /etc/apache2/httpd.conf

Explanation: On new systems (since Suse Linux V9.0) are these the correct files. On older systems (before Suse Linux V9.0) the apache config file is found in /etc/httpd.conf

QUESTION 277:

What configuration file and directive will alter your apache server IP and or port that it listens to?

- A. Port
- B. IPAddress
- C. Listen
- D. MinSpareServers

Answer: C

Explanation:

The httpd.conf file is the main configuration file for the Apache web server. A lot of options exist, and it's important to read the documentation that comes with Apache for more information on different settings and parameters. The following configuration example is a minimal working configuration file for Apache, with SSL support. Also, it's important to note that we only comment the parameters that relate to security and optimization, and leave all the others to your own research. Edit the httpd.conf file, vi /etc/httpd/conf/httpd.conf and add/change:

```
### Section 1: Global Environment #

SSLCACertificateFile /etc/ssl/certs/ca.crt SSLCARevocationPath
This tells httpd.conf to set itself up for this particular configuration setup with:
ServerType standalone
```

The option `ServerType` specifies how Apache should run on the system. You can run it from the super-server `inetd`, or as standalone daemon. It's highly recommended to run Apache in standalone type for better performance and speed.

`ServerRoot "/etc/httpd"`

The option `ServerRoot` specifies the directory in which the configuration files of the Apache server lives. It allows Apache to know where it can find its configuration files when it starts.

`PidFile /var/run/httpd.pid`

The option `PidFile` specifies the location where the server will record the process id of the daemon when it starts. This option is only required when you configure Apache in standalone mode.

ResourceConfig /dev/null

The option ResourceConfig specifies the location of the old srm.conf file that Apache read after it finished reading the httpd.conf file. When you set the location to /dev/null, Apache allows you to include the content of this file in httpd.conf, and in this manner, you have just one file that handles all your configuration parameters for simplicity.

AccessConfig /dev/null

The option AccessConfig specifies the location of the old access.conf file that Apache read after it finished reading the srm.conf file. When you set the location to /dev/null, Apache allows you to include the content of this file in httpd.conf, and in this manner, you have just one file that handles all your configuration parameters for simplicity.

Timeout 300

The option Timeout specifies the amount of time Apache will wait for a GET, POST, PUT request and ACKs on transmissions. You can safely leave this option on its default values.

KeepAlive On

The option KeepAlive, if set to On, specifies enabling persistent connections on this web server. For better performance, it's recommended to set this option to On, and allow more than one request per connection.

MaxKeepAliveRequests 0

The option MaxKeepAliveRequest specifies the number of requests allowed per connection when the KeepAlive option above is set to On. When the value of this option is set to 0 then unlimited requests are allowed on the server. For server performance, it's recommended to allow unlimited requests.

KeepAliveTimeout 15

The option KeepAliveTimeout specifies how much time, in seconds, Apache will wait for a subsequent request before closing the connection. The value of 15 seconds is a good average for server performance.

MinSpareServers 16

The option MinSpareServers specifies the minimum number of idle child server processes for Apache, which is not handling a request. This is an important tuning parameter regarding the performance of the Apache web server. For high load operation, a value of 16 is recommended by various benchmarks on the Internet.

MaxSpareServers 64

The option MaxSpareServers specifies the maximum number of idle child server processes for Apache, which is not handling a request. This is also an important tuning parameter regarding the performance of the Apache web server. For high load operation, a value of 64 is recommended by various benchmarks on the Internet.

StartServers 16

The option StartServers specifies the number of child server processes that will be created by Apache on start-up. This is, again, an important tuning parameter regarding the performance of the Apache web server. For high load operation, a value of 16 is recommended by various benchmarks on the Internet.

MaxClients 512

The option MaxClients specifies the number of simultaneous requests that can be

supported by Apache. This too is an important tuning parameter regarding the performance of the Apache web server. For high load operation, a value of 512 is recommended by various benchmarks on the Internet.

MaxRequestsPerChild 100000

The option **MaxRequestsPerChild** specifies the number of requests that an individual child server process will handle. This too is an important tuning parameter regarding the performance of the Apache web server.

User www

The option **User** specifies the UID that Apache server will run as. It's important to create a new user that has minimal access to the system, and functions just for the purpose of running the web server daemon.

Group www

The option **Group** specifies the GID the Apache server will run as. It's important to create a new group that has minimal access to the system and functions just for the purpose of running the web server daemon.

DirectoryIndex index.htm index.html index.php index.php3 default.html index.cgi

The option **DirectoryIndex** specifies the files to use by Apache as a pre-written HTML directory index. In other words, if Apache can't find the default index page to display, it'll try the next entry in this parameter, if available. To improve performance of your web server it's recommended to list the most used default index pages of your web site first.

Include conf/mmap.conf

The option **Include** specifies the location of other files that you can include from within the server configuration files **httpd.conf**. In our case, we include the **mmap.conf** file located under **/etc/httpd/conf** directory. This file **mmap.conf** maps files into memory for faster serving. See the section on Optimizing Apache for more information.

HostnameLookups Off

The option **HostnameLookups**, if set to **Off**, specifies the disabling of DNS lookups. It's recommended to set this option to **Off** in order to save the network traffic time, and to improve the performance of your Apache web server

QUESTION 278:

What Apache directive must you change when using **inetd** to control your Apache server?

- A. **ServerType**
- B. **ServerInetd**
- C. **InetServer**
- D. **StartServer**
- E. **ServerMethod**

Answer: A

Explanation:

ServerType standalone

The option ServerType specifies how Apache should run on the system. You can run it from the super-server inetd, or as standalone daemon. It's highly recommended to run Apache in standalone type for better performance and speed.

QUESTION 279:

Which Apache Directive specifies the location of the HTTP documents?

- A. RootDocument
- B. ServerRoot
- C. DocumentRoot
- D. RootServer
- E. DocPath

Answer: C

QUESTION 280:

What command can be used to shut down the Apache server gracefully?

- A. apacheshut
- B. apachectl
- C. apachestop
- D. apachestart

Answer: B

Explanation: But the option is missing.

QUESTION 281:

What is the recommended setting for StartServers in a medium sized Apache installation?

- A. 5
- B. 10
- C. 15
- D. 20

Answer: B

QUESTION 282:

How many spare server processes are required by Apache for the typical, low-to-moderate volume website?

- A. 1
- B. 50
- C. 10
- D. 200

Answer: C

QUESTION 283:

When an Apache server is configured to provide 10 spare server processes, which kind of website would it typically serve?

- A. A low-to-moderate volume website
- B. A website for no more than 10 users
- C. A high volume web site
- D. A one-user volume website

Answer: A

QUESTION 284:

In order to allow a Win95 host to resolve the name of and map network drives to your Linux server, what services should be running? Choose Two.

- A. nmbd
- B. smbd
- C. named
- D. routed
- E. winsd

Answer: A, B

QUESTION 285:

What is the simplest method to connect a Win98 host to a Linux Server?

- A. Velcro
- B. Samba
- C. NFS
- D. DNS
- E. WINS

Answer: B

QUESTION 286:

What is true about the root user and NFS?

- A. NFS shares don't allow root access by default
- B. NFS automatically masks out share permissions
- C. NFS automatically maps all root UID's to the local user "rootsquash"
- D. NFS ignores all users with a UID of 0 and a GID of 0
- E. NFS pays no attention whatsoever to security

Answer: A

QUESTION 287:

What configuration files on a Linux Server can be configured to share file systems with clients? Choose Two.

- A. /etc/nmbd
- B. /etc/smbd
- C. /etc/smb/samba.conf
- D. /etc/smb.conf
- E. /etc/samba/smb.conf

Answer: D, E

QUESTION 288:

What command is used to monitor connections to the SMB server?

- A. smbclient
- B. testparm
- C. smbstatus
- D. smbstat

Answer: C

QUESTION 289:

What is the command to map a Windows user ID to a Linux user ID for use with the Samba Server?

- A. smbuser
- B. smbpasswd
- C. smbadduser
- D. useradd smb
- E. useradd

Answer: C

QUESTION 290:

CORRECT TEXT

What file do you configure to make changes to your smbd and nmbd daemons?
Type the full path and name of the file.

Answer: /etc/smb.conf

Answer: /etc/samba/smb.conf

QUESTION 291:

CORRECT TEXT

Type in the command to monitor connections to Samba:

Answer: smbstatus

QUESTION 292:

CORRECT TEXT

You wish to restart both Samba daemons. Type in the command and any arguments that to accomplish this without using any absolute pathnames:

Answer: service smb restart

QUESTION 293:

CORRECT TEXT

Type in the name of the samba daemon that is responsible for WINS names resolution

Answer: nmbd

QUESTION 294:

Which option in the /etc/fstab file causes all users IDs to be mapped to the system's anonymous ID when mounting a NFS mounted file system?

- A. no-root-squash
- B. all-squash
- C. all-id-squash
- D. root-squash

Answer: B

QUESTION 295:

Which fstab option governs that all root ID are mapped to anonymous ID when mounting a NFS mounted file system?

- A. no-root-squash
- B. root-squash
- C. all-squash
- D. squash-root

Answer: B

QUESTION 296:

This is a line from the file /etc/export:
/product Certkiller (rw)
What does it mean?

- A. Only user Certkiller may access the filesystem /product when it is NFS mounted.
- B. This computer will mount the filesystem /product on Certkiller via NFS.
- C. The filesystem /product is exported for NFS mount to computer Certkiller .
- D. All NFS access to /product will use suid Certkiller .

Answer: C

QUESTION 297:

You are not using the WINS service on your network, but need to provide NETBIOS resolution to your hosts. What is the name of the daemon that provides these services on a Linux server?

- A. nmbd
- B. dns
- C. winsd
- D. lmhosts
- E. smbd

Answer: A

QUESTION 298:

These lines are taken from /etc/smb.conf:
workgroup = group1

guest account = nobody

What else is needed for this to work?

- A. nobody must be a valid group on the server.
- B. nobody must be a user name listed in /etc/passwd.
- C. group1 must be a valid group on the server.
- D. workgroup must be a valid group on the server.

Answer: B

QUESTION 299:

CORRECT TEXT

Type the command to check the syntax and contents of the smb.conf file:

Answer: testparm

QUESTION 300:

CORRECT TEXT

Type in the name of the samba daemon that is responsible for printer and file sharing:

Answer: smbd

QUESTION 301:

Which daemon allows Linux to share its file systems and printers with unmodified Windows clients?

- A. X Window
- B. nmbd
- C. smbd
- D. WINS
- E. NFS

Answer: C

QUESTION 302:

Shares can be configured for export via the NFS service by editing what file?

- A. /etc/exports
- B. /etc/export
- C. /etc/exportfs
- D. /etc/nfs/exports

Answer: A

QUESTION 303:

CORRECT TEXT

What file contains a list of directories for an NFS daemon to server to other systems?
(Provide the complete answer)

Answer: /etc/exports

QUESTION 304:

CORRECT TEXT

You are running a machine which exports a list of directories using NFS.
Provide the complete path to the file which contains this list.

Answer: /etc/exports

QUESTION 305:

Which two services resolve Netbios names to IP addresses?

- A. WINS
- B. NetbiosSVC
- C. smbd
- D. nmbd
- E. DNS

Answer: A, D

QUESTION 306:

Which of the following brings up a user friendly GUI interface (choose all that apply):

- A. make xconfig
- B. make menuconfig
- C. make config
- D. make compile

Answer: A, B

Explanation:

The "make xconfig" or "make menuconfig" brings up a user friendly GUI interface. And

"make config" brings up command-line console mode interface. You can load the configuration file from /usr/src/linux/.config (dot config file. Note the dot before config).

QUESTION 307:

CORRECT TEXT

What file contains a list of shared directories on a Linux/Unix system? Type the full path and name of the file.

Answer: /etc/exports

QUESTION 308:

CORRECT TEXT

Type in the name and full path to the network configuration file that defines the search order for name resolution:

Answer: /etc/nsswitch.conf

QUESTION 309:

CORRECT TEXT

What file with full path is used to set the location to query for hostname resolution outside of the local system?

Answer: /etc/resolv.conf

QUESTION 310:

What files affect the name resolution functionality of a Linux host? Choose Three.

- A. /etc/resolv.conf
- B. /etc/hosts
- C. /etc/default/names
- D. /etc/nsswitch.conf
- E. /etc/inet/hosts

Answer: A, B, D

QUESTION 311:

Which port is used for DNS

- A. 110
- B. 21
- C. 23

- D. 52
- E. 53

Answer: E

QUESTION 312:

What are reverse DNS entries used for?

- A. Reverse DNS enable diagnostic commands like traceroute to work.
- B. Reverse DNS gives you information about the owner of the DNS entry.
- C. Reverse DNS provides the hostname for a particular numeric IP address.
- D. Reverse DNS provides geographical information about the DNS net location.

Answer: C

QUESTION 313:

What file determines the DNS servers used by your computer?

- A. /etc/hosts
- B. /etc/named.conf
- C. /etc/nsswitch.conf
- D. /etc/resolv.conf

Answer: D

QUESTION 314:

This is the file /etc/named.boot from the computer named tellus with IP address 128.66.12.10.

directory /etc

secondary Certkiller .com 128.66.12. Certkiller .com.hosts

secondary 66.128.IN-ADDR.ARPA 128.66.12.5 128.66.rev

primary 0.0.127.IN-ADDR.ARPA named.local

cache named.ca

From this file, you know that:

- A. tellus is the primary DNS server for domain Certkiller .com.
- B. There is a secondary DNS server for domain Certkiller .com at the IP address 128.66.12.5.
- C. tellus is a secondary DNS server for domain Certkiller .com and it downloads the domain data from the server at IP address 128.66.12.5.
- D. The server at IP address 128.66.12.5 is allowed to download domain and reverse lookup data from tellus.

Answer: B

QUESTION 315:

When you use DNS to find a hostname using a particular IP address, which kind of DNS entry is involved?

- A. Reverse DNS entries
- B. IP DNS entries
- C. Address DNS entries
- D. Network DNS entries

Answer: A

QUESTION 316:

CORRECT TEXT

In the /etc/resolv.conf file are entries that describe where DNS queries can resolve names to IP addresses. Given a DNS server with an IP address of 192.168.33.254, type the exact entry that should appear in this file:

Answer: nameserver 192.168.33.254

QUESTION 317:

CORRECT TEXT

Type in the name and full path to the config file that contains the IP address of DNS servers for hostname resolution:

Answer: /etc/resolv.conf

QUESTION 318:

What file on a system contains a list of hosts that can't connect to the machine's services?

- A. /etc/hosts/denial
- B. /etc/hosts.deny
- C. /etc/host.notallow
- D. /etc/inetd.conf
- E. /etc/hosts.not

Answer: B

QUESTION 319:

Which configuration option can you use to prevent the root user from logging directly onto a machine using ssh?

- A. NoRootLogon
- B. PermitRootLogin No
- C. NoRootLogon Yes
- D. RootLogin = No
- E. ProhibitRootLogon No

Answer: B

QUESTION 320:

Which of the following services would you be least likely to configure to be governed over by the Internet Super Server?

- A. ftp
- B. telnet
- C. ssh
- D. finger
- E. bind

Answer: C

QUESTION 321:

The files /etc/hosts.allow, /etc/hosts.deny and /etc/nologin all exist on your computer, and the sshd daemon is running. What will happen when users try to connect with ssh?

- A. Only connections from computers specified in /etc/hosts.allow will be allowed to log in.
- B. Only root will be allowed to log in.
- C. All users not specified in /etc/hosts.deny will be allowed to log in.
- D. No user will be allowed to log in.

Answer: B

QUESTION 322:

The file /etc/ssh_host_key should be:

- A. world-readable
- B. readable to group sys

- C. readable to root only
- D. readable by all SSH users

Answer: D

QUESTION 323:

What command will verify the syntax of a hosts.allow and hosts.deny file combination?

- A. tcpdchk
- B. verify --tcp
- C. ipswitch
- D. tcpdump
- E. tcpdmatch

Answer: A

QUESTION 324:

Which one of the following lines would you expect to see on the file /etc/hosts.allow?

- A. in.tftpd: LOCAL
- B. tftp dgram udp wait root /usr/sbin/tcpd in tdtcpd
- C. tftp 69/udp
- D. udp 17 UDP

Answer: A

QUESTION 325:

What files affect the functioning of TCP Wrappers? Choose Two.

- A. /etc/hosts.deny
- B. /etc/nsswitch.conf
- C. /etc/security/authconfig
- D. /etc/default/clients
- E. /etc/hosts.allow

Answer: A, E

QUESTION 326:

CORRECT TEXT

What command with options will find all files on your system that have either the

SUID or GUID bits set? Type the exact command with options to accomplish this.

Answer: find / -perm +6000

QUESTION 327:

Select the files that are associated with TCP Wrappers. Choose all that apply.

- A. /etc/hosts
- B. /etc/hosts.allow
- C. /etc/hosts.deny
- D. /etc/allow.hosts
- E. /etc/allow.deny

Answer: B, C

QUESTION 328:

CORRECT TEXT

Your user matt has forgotten his passwd and you wish to reset it. Type in the command line to change his password (you are currently logged in as root):

Answer: passwd matt

QUESTION 329:

What command will set a regular users password, so it forces them to change it every 60 days? Choose all that apply.

- A. passwd -x 60 user1
- B. chage -M 60 user1
- C. passwd +x 60 user1
- D. useradd -e 60 user1
- E. usermod -f 60 user1

Answer: A, B

QUESTION 330:

What command will convert your shadow password file to md5 compatible passwords?

- A. passconv
- B. pwconv
- C. mdconv
- D. mdsum

E. passwd --convert

Answer: B

QUESTION 331:

You've decided to convert from standard shadow passwords to MD5 passwords. You make the appropriate changes to the /etc/pam.d/ files. What should you do next?

- A. Nothing, the passwords will be changed as users login and out.
- B. Nothing, users will be automatically prompted to change their passwords at the next login.
- C. You need to manually change all the passwords using the passwd program.
- D. Delete and recreate all the users.
- E. Change the /etc/pam.d files back because shadow passwords and MD5 passwords are incompatible.

Answer: C

QUESTION 332:

On a system using shadowed passwords, the correct permissions for /etc/passwd are ____ - and the correct permission for /etc/shadow are _____.

- A. -rw-r-----, -r-----
- B. -rw-r--r--, -r--r--r--
- C. -rw-r--r--, -r-----
- D. -rw-r--rw-, -r-----r--
- E. -rw-----, -r-----

Answer: C

QUESTION 333:

Which of the following files has the correct permissions?

- A. -rw--w--w- 1 root root 369 Dec 22 22:38 /etc/shadow
- B. -rwxrw-rw- 1 root root 369 Dec 22 22:38 /etc/shadow
- C. -rw-r--r-- 1 root root 369 Dec 22 22:38 /etc/shadow
- D. -rw----- 1 root root 369 Dec 22 22:38 /ect/shadow

Answer: D

QUESTION 334:

Your investigation of a system turns up a file that contains the line below:

```
find /home -iname .rhosts -exec rm -f {} \;
```

What is the purpose of this script?

- A. To enhance system security
- B. To remove all program error dumps
- C. To remove all temporary files in the user's home directories
- D. To reset the configuration for the rsh and rexec utilities

Answer: A

QUESTION 335:

What will the following line in the /etc/exports file do?

```
/data snowblower(rw) badhost (ro)
```

- A. Give snowblower rw access to the data share, deny badhost any access, and allow ro for all other hosts
- B. Give snowblower rw access to the data share, give badhost ro access to share and deny all others
- C. Give snowblower no access to the data share, give badhost rw access and set ro access for all others
- D. Cause a syntax error

Answer: B

QUESTION 336:

What command would be used to check the gpgp signature on a downloaded source file? Type just the name of the command:

Answer: gpg

QUESTION 337:

To prevent users from seeing who is logged in with the who command, you must remove the world readable but from the file /var/run _____.

Answer: utmp

QUESTION 338:

Of the ways listed, which is the best way to temporarily suspend a user's ability to interactively login?

- A. Changing the user's UID.

- B. Changing the user's password.
- C. Changing the user's shell to /bin/false.
- D. Removing the user's entry in /etc/passwd.
- E. Placing the command logout in the user's profile.

Answer: C

QUESTION 339:

You have a user whose account you want to disable but not remove.
What should you do?

- A. Edit /etc/gshadow and just remove his name.
- B. Edit /etc/passwd and change all numbers to 0.
- C. Edit /etc/shadow file and remove the last field.
- D. Edit /etc/passwd and insert an * after the first :.
- E. Edit /etc/group file and put a # sign in front of his name.

Answer: D

QUESTION 340:

Which of the following regarding user account configuration is true (choose all that apply):

- A. username is case-sensitive
- B. password is case-sensitive
- C. username is case-insensitive
- D. password is case-insensitive

Answer: A, B

Explanation Please note that everything should be entered in lowercase, except for the full name of the user which can be entered in a "pleasing format" (eg. Joe Smith) and the password. Case is sensitive, so inform your user(s) they must use identical case when entering their username and password.

QUESTION 341:

To create a user account, keep in mind that the username is at most ____ characters long.

- A. 6
- B. 8
- C. 12
- D. 18

Answer: B

Explanation Please note that everything should be entered in lowercase, except for the full name of the user which can be entered in a "pleasing format" (eg. Joe Smith) and the password. Case is sensitive, so inform your user(s) they must use identical case when entering their username and password.

QUESTION 342:

Rate this comment: The "root" account has no security restrictions imposed upon it.

- A. True
- B. False

Answer: A

Explanation When using this account it is crucial to be as careful as possible. The "root" account has no security restrictions imposed upon it. This means it is easy to perform administrative duties without hassle. However, the system assumes you know what you are doing, and will do exactly what you request -- no questions asked. Therefore it is easy, with a mistyped command, to wipe out crucial system files.

QUESTION 343:

Type the full path and name of the file whose global read bit you would change to deny normal users the ability to get useful information from the who and w commands.

Answer: /var/run/utmp

QUESTION 344:

What command was typed in to produce the output shown below? The entries shown are the full output of the command, less the actual command. Type the command and the options to reproduce similar output:

```
USER PID %CPU %MEM VSZ RSS TTY STAT START TIME COMMAND
root 394 0.0 0.0 1200 444 tty1 S 01:05 0:00 /sbin/getty 38400 tty1
root 396 0.0 0.0 1200 444 tty3 S 01:05 0:00 /sbin/getty 38400 tty3
root 397 0.0 0.0 1200 444 tty4 S 01:05 0:00 /sbin/getty 38400 tty4
root 398 0.0 0.0 1200 444 tty5 S 01:05 0:00 /sbin/getty 38400 tty5
root 399 0.0 0.0 1200 444 tty6 S 01:05 0:00 /sbin/getty 38400 tty6
root 423 0.0 0.0 1200 444 tty2 S 01:06 0:00 /sbin/getty 38400 tty2
root 426 0.2 0.3 2880 1964 pts/0 S 01:07 0:00 -bash
```

Answer: ps -aux

QUESTION 345:

User Bob Swanson (bswanson) has left Certkiller .com. His data has already been removed from his directory. How do you remove his account and directory?

- A. `rm -rf /home/bswanson`
- B. `deluser /home/bswanson`
- C. `userdel -r bswanson`

Answer: C

Explanation: `userdel` command is used to remove the user from the system. Where `-r` option is used to remove the user with home directory.

`userdel username` : Deletes the user from system but preserves the user's home directory.

#`userdel -r username` : Deletes the user with home directory.

QUESTION 346:

The _____ command is used to modify or set the password expiration for a user.

Answer: `passwd`

Answer: `usermod`

Explanation: `usermod` command is used to modify the user's account.

#`usermod -g groupname username` : Make user primarily belongs to group

#`usermod -G groupname username` : Make user Supplimentarily belongs to group

#`usermod -d directory username` : Set the home directory

#`usermod -s shell username` :Change the login shell

#`usermod -L username` : Locks the user account

#`usermod -U username` : Unlocks the user account

#`usermod -E data username` :Sets account expiration date

QUESTION 347:

You have an automated backup via tar to your tape drive `/dev/st0` that runs each night. You've decided to manually check last night's tape. The command to list the contents of the tape is _____.

Answer: `cpio -t < /dev/st0`

QUESTION 348:

A cronjob must run at least every 11 minutes. The job may take up to 7 minutes to

complete, and there mustn't be two jobs at the same time. Which crontab line solves the problem?

- A. */8 * * * * myjob
- B. */9 * * * * myjob
- C. */10 * * * * myjob
- D. */11 * * * * myjob
- E. */12 * * * * myjob

Answer: D

Explanation : Time can specify using *, / and , etc wildcard.

Example: 3,4,5 means in 3, 4 and 5, */20 on every 20, * on every etc

Time pattern of cron schedule is :

Minute Hour Day Of Month Month Day of Week Command

Minute can be: 0-59

Hour can be: 0-23

Day of Month can be : 1-31

Month can be : 1-12

Day of Week can be : 0-7 where 0 or 7 is Sunday.

QUESTION 349:

You need to sync your hardware clock, which is on GMT, with your system clock, which you just updated with NTP. To do this, complete the following command:

_____ -u --systohc

Answer: hwclock

Explanation: hwclock command query and sets the hardware clock.

QUESTION 350:

The system utility that automatically creates new log files and moves old ones is called what?

- A. newlog
- B. mvlog
- C. rotatelog
- D. logrotate

Answer: D

Explanation: logrotate rotates, compress, rename the log files to becoming the very large log file. It automatic rotates, compresses, renames and deletes the old log files by reading /etc/logrotate.conf configuration file.

QUESTION 351:

You discover a pending job for the at command. Which of the following do you have to use to remove it?

- A. atrm
- B. atq -r
- C. at -r
- D. rmat

Answer: A

Explanation:

atrm is used to remove the pending at jobs, it requires the job id number.

Example:

#atrm 2 : Where 2 is at job id

QUESTION 352:

You've downloaded an image file of a boot floppy disk to your hard drive. What is the best utility to create a boot floppy from the disk image? (Specify a single command without options.)

Answer: dd

Explanation: dd command creates the disk images. Example:

dd if=diskboot.img of=/dev/fd0 : which creates the image of diskboot.img and transfer into floppy disk.

QUESTION 353:

The _____ command is used to print out the current date and time on the system.

Answer: date

Explanation: date command is used to set or display the system date and time.

#date -s "new date and time" : It sets the new date and time into system

QUESTION 354:

To see the current time set by a NTP clock, you use the command

- A. ntpd -clock
- B. ndtime
- C. hwdate

D. ntpdate

Answer: A

Explanation: The ntpd program is an operating system daemon which sets and maintains the system time of day in synchronism with Internet Standard time servers. ntpd -clock command shows the current time set by NTP.

QUESTION 355:

Which TWO daemons may be used to support various routing protocols under Linux?

- A. gated
- B. ripd
- C. ospfadm
- D. bgpd
- E. routed

Answer: A, E

QUESTION 356:

The following output shows an excerpt from a standard network configuration file:

```
time 37/tcp timeserver
time 37/udp timeserver
rlp 39/udp resource # resource location
name 42/udp nameserver
whois 43/tcp nickname # usually to sri-nic
domain 53/tcp
domain 53/udp
mtp 57/tcp # deprecated
bootps 67/udp # bootp server
bootpc 68/udp # bootp client
tftp 69/udp
```

Which file could this be from?

- A. /etc/hosts
- B. /etc/inetd.conf
- C. /etc/named.conf
- D. /etc/services
- E. /etc/syslog.conf

Answer: D

Explanation: /etc/services file maps the TCP/UDP ports to common resources.

QUESTION 357:

The _____ file contains the system default options for the PPP daemon.

Answer: /etc/ppp/options

Explanation:

daemon pppd and a program named chat that automates the dialing of the remote system.

QUESTION 358:

What is the highest numbered TCP/IP port?

- A. 2047
- B. 32767
- C. 65535
- D. 131071

Answer: C

There are 65535 possible ports officially recognized.

Note: TCP uses the notion of port numbers to identify sending and receiving applications. Each side of a TCP connection has an associated 16-bit unsigned port number assigned to the sending or receiving application. Ports are categorized into three basic categories: well known, registered and dynamic/private. The well known ports are assigned by the Internet Assigned Numbers Authority (IANA) and are typically used by system-level or root processes. Well known applications running as servers and passively listening for connections typically use these ports. Some examples include: FTP (21), TELNET (23), SMTP (25) and HTTP (80). Registered ports are typically used by end user applications as ephemeral source ports when contacting servers, but they can also identify named services that have been registered by a third party. Dynamic/private ports can also be used by end user applications, but are less commonly so. Dynamic/private ports do not contain any meaning outside of any particular TCP connection.

QUESTION 359:

Which of the following is used to establish a PPP link to another computer?

- A. pppconn
- B. linkppp
- C. pppd
- D. pppconf

Answer: C

Explanation: On Linux, PPP functionality is split into two parts: a kernel

component that handles the low-level protocols (HDLC, IPCP, IPXCP, etc.) and the user space pppd daemon that handles the various higher-level protocols, such as PAP and CHAP. The current release of the PPP software for Linux contains the PPP

QUESTION 360:

Which of the following protocols uses two different network ports?

- A. NTP
- B. FTP
- C. Rsh
- D. HTTP
- E. Telnet

Answer: B

Explanation:

FTP (File Transfer Protocol) is used to transfer the file. Which service uses the two different ports 20 and 21.

QUESTION 361:

You can run the _____ command to see active network and UNIX domain socket connection.

Answer: netstat

Explanation:

netstat is the multi-purpose command use to print network connetions, routing tables, interface statistics, masquerade connections and multicast memberships.

netstat -sTU : prints all TCP and UDP ports used and being used.

QUESTION 362:

While checking your security, you discover that you can connect to one of the machines on the network via port 23. What should you do to the network service on this machine?

- A. Deactivate it, you don't need a SMTP server there.
- B. Deactivate it, you should not use TELNET.
- C. Leave active, SSH is safe.
- D. Deactivate it, you don't need a FTP server there.

Answer: B

Explanation:

According question, it is checking the secure and non-secure service.

Telnet also called non-secured service runs on port 23.

To deactivate telnet service:

chkconfig telnet off

service xinetd restart

QUESTION 363:

Which of the following represents a class C netmask?

A. 255.0.0.0

B. 255.255.0.0

C. 255.255.255.0

D. 255.255.255.255

Answer: C

Explanation:

By default Class C has 24 bits of network address so netmask is

255.255.255.0

11111111.11111111.11111111.0

Class A: 8 bits Network Address

11111111.0.0.0 : 255.0.0.0

Class B: 16 Bits Network Address

11111111.11111111.0.0 : 255.255.0.0

QUESTION 364:

Which of the following PPP authentication protocols never sends a password in the clear?

A. PAM

B. PAP

C. PGP

D. CHAP

Answer: D

Explanation:

CHAP

Challenge Handshake Authentication Protocol. A security feature supported on lines using PPP encapsulation that prevents unauthorized access. CHAP does not access server then determines whether that user is allowed access.

QUESTION 365:

You are working on a server that has multiple ethernet network interfaces, and you wish to find out the IP address assigned to the eth1 interface. Which of the following commands will print the necessary information?

- A. `ipconfig /dev/eth1`
- B. `ethconfig -d eth1`
- C. `ifconfig eth1`
- D. `prntconf eth1`

Answer: C

Explanation:

`ifconfig` is used to configure the kernel-resident network interfaces. It is used at boot time to set up interfaces as necessary.

`ifconfig` : display the layer 2 and layer 3 information of all enabled interfaces.

`ifconfig eth1` : displays the layer 2 and layer 3 information of eth1 interfaces.

QUESTION 366:

Consider the following command and an abbreviated version of its output:

```
$ netstat -nr
```

Kernel IP routing table

Destination	Gateway	Genmask	Flags	Iface
-------------	---------	---------	-------	-------

192.168.165.0	0.0.0.0	255.255.255.0	U	eth0
---------------	---------	---------------	---	------

127.0.0.0	0.0.0.0	255.0.0.0	U	lo0
-----------	---------	-----------	---	-----

0.0.0.0	192.168.165.1	0.0.0.0	UG	eth0
---------	---------------	---------	----	------

What is the default gateway for the network?

- A. 192.168.165.1
- B. 255.0.0.0
- C. 255.255.255.0
- D. 0.0.0.0
- E. 192.168.165.0

Answer: A

Explanation:

when you use the `netstat -nr` or `route -n` command it prints the routing table configured in your linux system.

0.0.0.0 192.168.165.1 UG 0 0 eth0 Where 192.168.165.1 is the default gateway for all network and packets goes through eth0 interface.

QUESTION 367:

Your ISP has given you an IP block for your use. The block is 192.168.112.64/26. If your network administrator uses the first usable IP for the router he's installed on your network, how many usable IPs do you have left?

Answer: 61

Explanation:

32 bits of IP address minus 26 bits is 6 bits.

minus 1 for address of network

minus 1 for address of broadcast

minus 1 for address of router

$2^6 - 3 = 61$

QUESTION 368:

You want to add an alias for an existing DNS record. What type of DNS record could you use?

- A. CNAME
- B. MX
- C. SOA
- D. NS

Answer: A

Explanation:

CNAME helps to aliases to existing host in DNS record.

Example:

mail IN A 192.168.100.1

pop IN CNAME mail

QUESTION 369:

What is the name of the primary configuration file for Apache?

- A. srm.cfg
- B. httpd.cfg
- C. access.cfg
- D. apache.conf
- E. httpd.conf

Answer: E

Explanation:

/etc/httpd/conf/httpd.conf is the primary configuration file for apache web server and /etc/httpd/conf.d/ssl.conf is the configuration file for HTTPS.

QUESTION 370:

When you run the command newaliases, it will:

- A. ask for input on stdin to create new mail aliases.
- B. restart sendmail.
- C. remove the aliases currently configured.
- D. rebuild the aliases database for the file /etc/aliases.

Answer: D

Explanation:

/etc/aliases file is used to send the mail to different address then coming address.

Syntax: boob: peter : means mail of boob will get by peter. After modifying the file /etc/aliases you should re-build the database using newaliases command

QUESTION 371:

You have generated a DSA authentication key on host linux1. In order to log into host linux2 with the new key, what do you need to do?

- A. Copy the new authentication key into /etc/ssh/sshd_config on linux2.
- B. Copy the new authentication key into \$HOME/.ssh/authorized_keys on linux2.
- C. Copy the new authentication key into \$HOME/.ssh/id_dsa on linux2.
- D. Copy the new authentication key into \$HOME/.ssh/id_dsa on linux1.
- E. Log into linux2 using the command ssh --key.

Answer: B

Explanation:

Reference: <http://acd.ucar.edu/~fredrick/mpark/ssh/rsa-unix.html>

QUESTION 372:

The user bob complains that he cannot access his email. In witch directory would you look to see if there is any deliverable email for him?

- A. /var/spool/mail
- B. /var/mail/mqueue
- C. /var/spool/mqueue
- D. /home/bob/.mail

Answer: A

Explanation:

/var/spool/mail/ directory contains the user's spooling mail. If user unable to check the mail you should check the permission and owner of mail spooling file under /var/spool/mail

QUESTION 373:

Which file contains a list of services and hosts that will be denied by a TCP Wrapper such as tcpd? (type full path)

Answer: /etc/hosts.deny

Explanation:

The /etc/hosts.allow and /etc/hosts.deny each have two or more colon-separated fields. The first field specifies the comma separated list of executable name. The second field contains a comma-separated list of client specifications, using IP address or host name or network name.

httpd: 192.168.1.0/24 à specified the network

vsftpd: .example.com à specified the domain.

We can allow or deny to client by name or ip.

Example of /etc/hosts.deny

vsftpd:ALL à Deny the ftp service to all client

vsftpd: ALL EXCEPT .example.com

à Deny the ftp service to all client except example.com domain members.

QUESTION 374:

The normal way of starting your Apache server would be the command:

- A. apachectl start
- B. http -start
- C. inetd apache
- D. apachestart -n
- E. apache start

Answer: A

Explanation:

apachectl is the Apache HTTP server control Interface. You can start, stop, restart the httpd daemon as well as can check the configuration.

To start the httpd daemon: apachectl start

QUESTION 375:

You decide to use xinetd instead of inetd. Now, you need to transfer information from /etc/inetd.conf to another file. What file?

Answer: /etc/xinetd.conf

Explanation:

xinetd.conf is the configuration file that determines the services provided by xinetd.

/etc/inetd.conf is replaced by /etc/xinetd.conf.

QUESTION 376:

The _____ command is the Apache HTTP server control interface.

Answer: apachectl

Explanation:

apachectl is the Apache HTTP server control Interface. You can start, stop, restart the httpd daemon as well as can check the configuration.

To check the configuration of httpd.conf use the : apachectl configtest

To restart the httpd daemon: apachectl restart

QUESTION 377:

If you want to print a listing of your computer's mail queues, what command would you use?

- A. sendmail -l
- B. lpq
- C. mailq
- D. mlq

Answer: C

Explanation:

mailq command prints a summary of mail messages queued for future delivery.

Syntax: mailq [options]

mailq -Ac : show the mail submission queue specified in /etc/mail/submit.cf instead of the MTA queue specified in /etc/mail/sendmail.cf

QUESTION 378:

You want to make the directory /local available via NFS. Everything works fine, but on the client machine, the super user is unable to read any files on the NFS-mounted file system. Why?

- A. The NFS protocol does not allow this.

- B. The super user has different user IDs on the client and the server machine.
- C. The client, when mounting the NFS filesystem, must specify the option trusted.
- D. The exports entry on the server machine does not include the option no_root_squash.

Answer: D

Explanation:

Entries in /etc/exports are exported with root_squashing turned on.

This ensures that requests from the root user on a client machine are denied root access to root-owned files on a server machine. Such requests are mapped instead to a uid such as 65534. This behaviour can be defeated with the no_root_squash option but this not recommended.

QUESTION 379:

The _____ command prints a list of email that is currently in the queue waiting for delivery.

Answer: mailq

Explanation:

mailq command prints a summary of mail messages queued for future delivery.

Syntax: mailq [options]

mailq -Ac : show the mail submission queue specified in /etc/mail/submit.cf instead of the MTA queue specified in /etc/mail/sendmail.cf

QUESTION 380:

In your DNS configuration, MX records are used to point to the _____ server(s) for your domain. (Please specify a single word answer.)

Answer: email

Answer: e-mail

Explanation:

MX record in DNS configuration specifies the Mail Exchanger or mail server for the domain.

Example:

abc.com. IN MX 5 mail.abc.com.

abc.com. IN MX 10 mail1.abc.com.

Where mail.abc.com is the primary mail Exchanger for abc.com domain and mail1.abc.com is the secondary mail exchanger for the abc.com domain.

QUESTION 381:

The file /etc/ssh_known_hosts typically contains hosts keys for _____.

- A. all hosts that have logged into this server via ssh
- B. all hosts that users have logged into from this server via ssh
- C. clients allowed to connect to this host via ssh
- D. machines the system administrator trusts users to connect to using ssh

Answer: D

QUESTION 382:

Enter the command/servicename that dynamically assigns ports for Remote Procedure Calls (RPC) services like NIS, NFS and similar.

Answer: portmap

Explanation:

portmap is a server that converts RPC program numbers into DARPA protocol port numbers. It must be running in order to make RPC calls. When an RPC server is started, it will tell portmap what port number it is listening to, and what RPC program numbers it is prepared to serve.

QUESTION 383:

CORRECT TEXT

When a change is made to the file controlling what files are made available by NFS, what command must be run to make the changes effective? (Provide only the command name, not the path or any command switches.)

Answer: exportfs

Explanation: exportfs command is used to maintain the current table of exported file systems of NFS.

To List all shared data:

exportfs -v

To Refresh /etc/exports

exportfs -r

QUESTION 384:

You have a file /etc/resolv.conf, but the computer does not use the configured DNS servers to look up host names. What is most likely the problem?

- A. The hosts entry in your /etc/nsswitch.conf does not list dns.

- B. You do not have a /etc/named.conf file.
- C. The localhost hostname is not properly configured in /etc/hosts.
- D. The named daemon is not running on your computer.

Answer: A

Explanation:

/etc/nsswitch.conf file is called system databases and name service switch configuration file.

By default it checks in /etc/hosts if not found then only send the request to DNS server if

Hosts: files dns : is written in /etc/nsswitch.conf file.

QUESTION 385:

What configuration file contains the list of directories shared via NFS?

- A. /etc/share
- B. /etc/exports
- C. /etc/dfs/dfstab
- D. /etc/fstab

Answer: B

Explanation:

/etc/exports file is used to share the data via NFS.

Syntax: directory client(permission)

Example:

/public *(rw, sync)

/data *.example.com(ro, sync)

QUESTION 386:

What kind of DNS entries are used to get the hostname of a given IP address?

Please enter exactly ONE word.

Answer: reverse

Explanation:

i. Forward Lookup : resolves the hostname into IP address

ii. Reverse Lookup : Resolves the IP address into Hostname

QUESTION 387:

What command do you use to generate an OpenSSH host key?

- A. sshd
- B. ssh-agent
- C. ssh-keygen
- D. ssh-add

Answer: C

Explanation:

ssh-keygen command generates, manage and converts authentication keys for ssh. Ssh-keygen can create RSA keys for user by SSH protocol version 2. RSA or DSA for use by SSH version 2.

By default it will create the public key file and private key file in ~/.ssh/

Filename_dsa is the private key file

filename_dsa.pub is the public key file

QUESTION 388:

The _____ command is used to modify a user's account information.

Answer: usermod

Explanation: usermod command is used to modify the user accounts.

Example: usermod -L username :Locks the account

usermod -U username : Unlocks the account

usermod -e "date" username : sets the Account expire date

QUESTION 389:

Your FTP server has been under attack, and the ISP of the attacker has been less than helpful in mitigating the attacks. So you decide that all connections from that ISP (badguy.example.org) to your FTP server will be denied and sent a message. Which line in your /etc/hosts.allow will have the desired effect?

- A. in.ftpd : .badguy.example.org : twist 450 denied due to numerous attacks from this domain
- B. ftp : badguy.example.org : DENIED message 450 denied due to numerous attacks from this domain
- C. in.ftpd : badguy.example.org : spawn echo 450 denied due to numerous attacks from this domain
- D. ftp : .badguy.example.org : DENIED due to numerous attacks from this domain

Answer: A

Explanation:

The /etc/hosts.allow and /etc/hosts.deny each have two or more colon-separated fields. The first field specifies the comma separated list of executable name. The

second field contains a comma-separated list of client specifications, using IP address or host name or network name.

httpd: 192.168.1.0/24 à specified the network

vsftpd: .example.com à specified the domain.

To deny the service access you should write in /etc/hosts.deny

QUESTION 390:

You want to temporarily prevent users from logging in. Please complete the following command:

touch /etc/_____

Answer: nologin

Explanation:

pam_nologin.so module prevents non-root user login into the system, this module checks whether /etc/nologin file is created or not, if created deny to all non-root user to login locally.

QUESTION 391:

Which of the following services is NOT usually protected via TCP wrappers?

- A. ftp
- B. finger
- C. auth
- D. http

Answer: D

Explanation:

TCP wrappers control only the services linked with the libwrap.so

module i.e

sendmail

slapd

sshd

stunnel

xinetd

gdm

portmap

QUESTION 392:

Your gateway to the internet is using iptables and NAT to allow your private network to access the Internet. You've verified that the gateway is not set up to block packets, but you need to verify that it is properly masquerading them. Which

of the following commands would you use to look at your NAT tables?

- A. iptables -L -n
- B. iptables -t nat -L
- C. iptables -t mangle -L
- D. iptables -t filter -L

Answer: B

Explanation:

iptables is used to set up, maintain and inspect the tables of IP packet filter rules in the Linux kernel. Several different tables may be defined, each table contains a number of built-in chains and may also contain user-defined chains. Each chain is a list of rules which can match a set of packets. Each rule specifies what to do with a packet that matches this is called target.

You can list the policy and rules of iptables using the iptables -L command

Output will get in this syntax:

target prot opt source destination

Default table is filter: when you use the iptables -L it will display the chains and rules of filter table.

To list rules of masquerading:

iptables -t nat -L

QUESTION 393:

For security reasons, the system administrator is setting up a log server. What file does the system administrator have to edit in order to have each machine send log entries to the new log server?

Answer: /etc/syslog.conf

Explanation:

/etc/syslog.conf is the log configuration file, where administrator can set where to send what type of logs !! . By default logs send to local system's under /var/log/different log files.

*.user @logserver.example.com : Logs generated by user will send to logserver.example.com host.

QUESTION 394:

Which command prints or adjusts the current limits on resources available to the shell and to processes started by it, such as the maximum size of a core file or the maximum number of processes running? (Please include the command only, without arguments or path.)

Answer: ulimit

Explanation:

ulimit provides control over the resources available to the shell and to processes started by it, on systems that allow such control. The -H and -S options specify that the hard or soft limit is set for the given resources.

QUESTION 395:

The _____ command is used to setup, view, and modify packet filtering, network and port translation, and other packet mangling rules within 2.4 and later kernel.

Answer: iptables

Explanation:

iptables is used to set up, maintain and inspect the tables of IP packet filter rules in the linux kernel. Several different tables may be defined. Each table contains a number of built-in chains and may also contain user-defined chains.

QUESTION 396:

Which of the following commands can typically be used to configure a kernel?

- A. ./config
- B. ./configure
- C. make config
- D. make configure

Answer: C

Explanation:

config is the least user-friendly option as it merely presents a series of questions that must be answered sequentially. Alas, if an error is made you must begin the process from the top. Pressing Enter will accept the default entry, which is in upper case.

QUESTION 397:

You just configured a kernel and now you want to check the dependencies. Please enter the command and its argument(s).

Answer: make dep

Explanation:

To check the dependencies of files you should use the make dep command.

Steps to re-compile the kernel

We have so far extracted and patched the Linux sources. During our preparation

we also determined what hardware is installed in the system so that we will know which modules will need compilation. Before we proceed to actually configuring the kernel there are a couple minor but important details to complete.

Inside the Linux source directory is the default Makefile. This file is used by the make utility to compile the Linux sources. The first few lines of the Makefile contains some versioning information:

VERSION = 2

PATCHLEVEL = 4

SUBLEVEL = 22

EXTRAVERSION = -1

Note that there is an additional EXTRAVERSION field. To prevent overwriting any existing kernel modules on the system we will change this EXTRAVERSION to something unique.

When the final installation steps are run, kernel module files will then get written to /lib/modules/\$VERSION.\$PATCHLEVEL.\$SUBLEVEL-\$EXTRAVERSION.

make mrproper
make config or make menuconfig or make oldconfig or make xconfig

make dep
make clean
make bzImage
make modules
make modules_install
mkinitrd

/boot/initrd-2.6.0.img 2.6.0mkinitrd -k vmlinux-VERSION -i initrd-VERSIONcp

arch/i386/boot/bzImage /boot/bzImage-KERNEL_VERSIONcp System.map

/boot/System.map-KERNEL_VERSIONln -s

/boot/System.map-KERNEL_VERSION /boot/System.map

QUESTION 398:

What commands will load a kernel module? (Select TWO answers)

- A. ldmod
- B. modprobe
- C. loadmod
- D. insmod
- E. modload

Answer: B, D

Explanation: To load the modules into the kernel, use the modprobe or insmod command.

modprobe modulename : Loads the module

insmod modulename: Loads the module

lsmod : list all loaded module

rmmod modulename: removes or unload the module from the kernel

modprobe -r modulename: removes or unload the module from the kernel

QUESTION 399:

You need maximum performance of your machine and therefore you decide to unload all dispensable modules. Which command would you use?

- A. rmmod

- B. insmod -r
- C. unmod
- D. module -r

Answer: A

Explanation:

rmmod command remove or unload the module from the kernel. You can use the lsmod command to list all loaded modules.

Example: rmmod modulename

Verify using lsmod command

QUESTION 400:

Which command would you use to apply the changes in a diff file to your existing kernel source?

- A. up2date
- B. patch
- C. rpm
- D. dpkg
- E. diff

Answer: B

Explanation:

patch takes a patch file containing difference listing produced by the diff program and applies those differences to one or more original files, producing patched versions.

QUESTION 401:

Upon booting one of your Linux boxes, you notice a message scrolling by that does not look right, but it goes so fast, you do not have a chance to read it. What command could you use to view that message after the boot process completes?

Answer: dmesg

Explanation:

dmesg command helps to print out their bootup messages. What messages are generated at boot time by kernel, you can read by using the dmesg command.

QUESTION 402:

Runlevels are configured _____.

- A. in the kernel
- B. in /etc/inittab
- C. in /etc/runlevels
- D. using the rl command
- E. in rc.sysinit or rc.local

Answer: B

Explanation:

Default runlevel, runlevel specific scripts are written in /etc/inittab file.

Id:5:initdefault: : which line defines the default runlevel

Similalry runlevel specific scripts to execute also written here:

Si::sysinit:/etc/rc.d/rc/rc.sysinit

10:0:wait:/etc/rc.d/rc 0

11:1:wait:/etc/rc.d/rc 1

12:2:wait:/etc/rc.d/rc 2

13:3:wait:/etc/rc.d/rc 3

14:4:wait:/etc/rc.d/rc 4

15:5:wait:/etc/rc.d/rc 5

16:6:wait:/etc/rc.d/rc 6

QUESTION 403:

The network connection needs to be started during bootup which requires that the drive module for the network card be loaded properly. Which of the following files is used to map an ethernet device (eth0, for example) to a specific driver module?

- A. /etc/module/config
- B. /etc/modules.conf
- C. /etc/conf/modules
- D. /etc/insmod.conf

Answer: B

Explanation:

Aliases provides uniform ways to address various types of hardware.

By default, aliases are used for ethernet interface, sound cards and usb conrollers.

See the example:

alias eth0 8139too : which creates the alias of 8139too module to eth0.

These aliases are written in /etc/modules.conf or /etc/modprobe.conf file.

QUESTION 404:

Which configuration file should be modified to disable the ctrl-alt-delete key combination?

- A. /etc/keys
- B. /proc/keys
- C. /etc/inittab
- D. /proc/inittab
- E. /etc/reboot

Answer: C

Explanation:

/etc/inittab file contains functions of ctrl-alt-delete key combinations.

ca::ctrlaltdel:/sbin/shutdown -t3 -r now

which means reboot the system after three seconds from now. If you want to disable this function just comment this line.

QUESTION 405:

Ghostscript can be used as:

- A. A Line Printer Daemon
- B. A print filter to convert PostScript data for non-PostScript printers
- C. A print filter to allow correct printing on PostScript printers
- D. A print filter to remove "ghosting" and "staircase" effect problems
- E. A graphical viewer for PostScript files

Answer: B

Explanation: Ghostscript also called the Postscript and PDF language interpreter, which converts the postscript file into non-postscript.

#enscript -p outputfile inputfile : Which creates the postscript file.

QUESTION 406:

Which of the following tools is used to configure CUPS?

- A. lpc
- B. lpadmin
- C. lpr
- D. lpd
- E. lpctrl

Answer: D

Explanation:

lpd is the CUPS line printer Daemon mini-server that supports legacy client systems that use the LPD protocol. Cups-lpd does not act as a standalone

network daemon but instead operates using the Internet "Super-Server" .
More : man cups-lpd

QUESTION 407:

Which of the following files is responsible for defining various options and values to control the printing and spooling of print jobs?

- A. /etc/printers
- B. /etc/print.conf
- C. /etc/printcap
- D. /etc/printd.conf

Answer: C

Explanation:

/etc/printcap file contains a list of printer definitions, location of the spool files. Each entry of the file describes a printer with fields separated by ":". The first entry is the name of printer is known by and any aliases separated by "|". Subsequent entries indicate the location and capabilities of the printer.

QUESTION 408:

You need to find the latest HOWTOs on using SATA devices. What web site hosts the latest HOWTOs?

Answer: www.serialata.org

Explanation:

www.serialata.org is the site provides the latest HOWTO's, documentation on using the SATA devices.

QUESTION 409:

The directory /usr/share/doc/ contains:

- A. HTML versions of man pages
- B. Man pages for installed packages
- C. Programs for reading documentation
- D. User-created documentation about the system
- E. Supplemental information about installed packages

Answer: E

Explanation:

/usr/share/doc directory contains the documentation for installed packages.

QUESTION 410:

What file is typically used to display messages at the login prompt when remote users telnet in to the machine?

- A. /etc/issue
- B. /etc/motd
- C. /etc/net.banner
- D. /etc/issue.net

Answer: D

Explanation:

/etc/issue file prints the pre-login message and identification for local login and /etc/issue.net file prints the messages for remote login.

QUESTION 411:

Your users report that they are using the program dia to create diagrams. They are having problems with the software and they think there is a bug. What command will give you help with functionality and contact information to report a possible bug?

Do not give the path or any options.

Answer: flea

QUESTION 412:

In compliance with the FHS, in which of the following places are man pages typically found?

- A. /usr/share/man
- B. /opt/man
- C. /usr/doc
- D. /var/pkg/man
- E. /usr/local/man

Answer: A

QUESTION 413:

You need to find all references in system document to the word "backup". What command would you type? (Do not provide full path).

Answer: grep

Explanation:

grep command prints the lines matching a pattern.

Example: grep root /etc/passwd : which prints all lines from /etc/passwd file having root pattern.

QUESTION 414:

Choose THREE websites that provide Linux-related news and documentation.

- A. Linux Scoop
- B. LWN.net
- C. Tux Facts
- D. Linux Today
- E. NewsForge

Answer: B, D, E

Explanation: Like tldp.org other web sites also provides the news and documentation related to linux. Like: lwn.net, linux today, newsforge, freshmeat.com etc.

QUESTION 415:

You find you execute a series of commands on a recurring basis. You want this series of commands available from your login to run in the current shell.

Choose the best solution:

- A. create a shell program
- B. create a function
- C. use the up arrow in BASH to find the command
- D. use BASH's built-in ! function to run the last iteration of the command by the same name

Answer: B

Explanation:

function is a collection of similar commands. To execute a series of commands on a recurring, you should create a function and execute it.

Creating function:

```
function()  
{  
command1  
command2  
command2
```

}

To execute function :

function1 : just call the function by name

QUESTION 416:

You are writing a script and want to test the exit status of a process. Which of the following is true?

- A. The normal exit value differs.
- B. You can't test the normal exit value.
- C. The normal exit value is \$EXIT.
- D. The normal exit value is 0.

Answer: D

Explanation:

When we run the scripts, it returns the exit value that can be either 0 or 1-255 where 0 means exited without error and non-zero means exited with error. Return value can print using echo \$?

QUESTION 417:

What command prints available functions?

- A. declare -f
- B. set
- C. typeset
- D. function()

Answer: A

Explanation:

declare -f command prints all available functions.

QUESTION 418:

A user complained that programs started from his shell won't use his favorite editor. Which of the following files should you edit to change this?

- A. .editor
- B. .bashrc
- C. .bash_rc
- D. ~/bash.conf

Answer: B

QUESTION 419:

What command will allow you to see all of your environment variables?

- A. echo \$*
- B. env
- C. which
- D. export

Answer: B

Explanation:

env command displays all environmental and set command displays all environmental as well as shell variables.

QUESTION 420:

CORRECT TEXT

The very first line of a shell script should always contain what two characters at the beginning of the line?

Answer: #!

Explanation: The first line in a shell scripts should contain 'magic', which is commonly referred to as the she-bang. This tells the operating system which interpreter to use in order to execute the script.

Some example:

#!/bin/bash : Used for bash scripts

#!/bin/sh : Used for Bourne shell scripts

#!/usr/bin/perl: Used for Perl Scripts

QUESTION 421:

Which of the following commands shows ONLY the user id of Bob? (Select TWO)

- A. cat /etc/passwd | grep Bob | cut -d: -f3
- B. cat /etc/passwd | grep Bob | cut -f: -d3
- C. grep Bob /etc/passwd | awk -F: '{print \$3 }'
- D. grep Bob /etc/passwd | awk -f: '{print \$3 }'
- E. grep Bob /etc/passwd | cut -F: -d3

Answer: A, C

Explanation:

cut command is used to display certain fields from file and grep

displays the line which matched the pattern.

Example: `cut -d: -f3 /etc/passwd` : where -d means field delimiter, -f means field number.

`grep root /etc/passwd` : displays the line having root pattern

Similarly awk is a programming language for editing text, searches a file for lines matching a pattern or patterns.

Example: `awk '/bash/ { print }' /etc/passwd` : which prints all lines having bash pattern.

QUESTION 422:

CORRECT TEXT

How to check if Apache's configuration file is correct?

Answer: `apachectl configtest`

Explanation: `apachectl` is the Apache HTTP server control Interface. You can start, stop, restart the `httpd` daemon as well as can check the configuration.

To check the configuration of `httpd.conf` use the : `apachectl configtest`

To restart the `httpd` daemon: `apachectl restart`

QUESTION 423:

We have a bash script `~/myscript` shown below:

```
shift
```

```
echo $2
```

We call this script: `~/myscript alpha beta gamma delta`

What will we see?

- A. alpha
- B. beta
- C. gamma
- D. delta

Answer: C

Explanation: Using a bash script we can print the parameter passing from the command line, which starts from 1 index number,

`echo $2` : prints the second parameter passing from the command line. `$*` means all parameters passing from the command line.

However, there is a `SHIFT` command before the `ECHO $2` command so the correct answer is gamma.

QUESTION 424:

`inetd.conf` was changed. How to reinit changes?

- A. restart inetd
- B. find inetd's PID and send signal 15 to it
- C. find inetd's PID and send signal SIGHUP to it
- D. ...

Answer: C

Explanation: find SIGHUP to it - is the correct line

QUESTION 425:

CORRECT TEXT

You are logged in as root. How to check user brown's group?

Answer: groups brown

Explanation: groups command prints group name belonging the user.
Example, groups user1 : prints the all group name in which user belongs

QUESTION 426:

What is the name of standard Linux service which provide RIP (Routing Information Protocol)?

- A. zebra
- B. -routed
- C. -ipchains

Answer: A

Explanation:
zebra is the service, which provides the facility to use different Routing Protocol in Linux. i.e RIP, OSPF etc

QUESTION 427:

You found these lines in the modules.dep file:

/lib/modules/2.2.5-15smp/fs/msdos.o:

/lib/modules/2.2.5-15smp/fs/fat.o

Which of the following is true?

- A. The msdos module is dependent upon fat.
- B. The fat and msdos modules cannot be loaded manually.
- C. The fat and msdos modules are automatically loaded at startup.
- D. The fat module is a submodule to the msdos module.

Answer: A

Explanation:

modules.dep file contains the list of module dependencies.

Whenever you try to load the module , it checks the dependencies, whether dependencies from modules.dep.

modules.dep file contains

module name : dependencies modules.

QUESTION 428:

Which utility is used to create the modules.dep file that is required by modprobe?

- A. ksyms
- B. makemod
- C. makedep
- D. lsmod
- E. depmod

Answer: E

Explanation:

/lib/modules/Kernel-Version/modules.dep file contains the entry of module dependencies, which is created by depmod command.

depmod creates a list of module dependencies, by reading each module modules.dep identifies the module dependencies.

QUESTION 429:

What file contains kernel level logging information such as output from a network driver module when it is loaded?

Answer: /var/log/messages

Explanation: /var/log/messages file contains the standard log messages as defined in /etc/syslog.conf file.

See the sample line of /etc/syslog.conf

*.info,mail.none;authpriv.none;cron.none /var/log/messages

QUESTION 430:

You are about to do some administration tasks on a server. Which command would you use to change the runlevel?

Answer: telinit

Explanation:

init or telinit is the parent of all processes. It's primary role is to create processes from a script stored in the file /etc/inittab.

To display the current and previous runlevel use the runlevel command

To change the runlevel

init runlevel or telinit runlevel

QUESTION 431:

In the LPD system, a print queue is defined in what file?

- A. /etc/lprconf
- B. /etc/printer
- C. /etc/printqueue
- D. /etc/printcap

Answer: D

Explanation:

/etc/printcap file contains the print queue name of the system.

QUESTION 432:

CORRECT TEXT

The normal filesystem location for the LPD queue directory is:

Answer: /var/spool/lpd/

Explanation: /var directory contains the spooling as well as log files.

/var/spool/cups contains the spooling queue of cups.

/var/spool/lpd contains the spooling queue of lpd

/var/spool/mail contains the mail spooling queue

QUESTION 433:

You need to find all references in system documentation to the word backup. What command would you type? (Do not provide full path)

Answer: grep

Explanation:

grep command print the lines matching the pattern from file.

Example: grep root /etc/passwd : It prints all lines having root pattern.

QUESTION 434:

With the web site, www.tldp.org, what does "tldp" stand for?

Answer: The Linux Documentation Project

Explanation:

tldp is the Linux Documentation Project, which maintains the Linux HOWTO's, Documentation etc.

QUESTION 435:

Which file would be used to configure a user's interactive bash shell?

- A. ~/.int_bash
- B. .bashrc
- C. .profile
- D. .bash

Answer: B

Explanation:

Some important files are in user's home directory, which is used to modify the user's bash shell i.e .bash_profile, .bashrc, .bash_history, .nash_logout etc.

.bash_profile: This file is used to run the user specific startup program, to set the value in environmental variable.

.bashrc : This file is used to set the user specific aliases, functions.

QUESTION 436:

Which of the following commands is used to restore files from backups made with dump?

- A. extract
- B. cpio -d
- C. restore
- D. udump

Answer: C

Explanation:

dump is the standard backup utility in Linux, using dump utility we can take either full or incremental backup.

Example: `dump -0u -f /dev/sda /dev/hda7` : which takes the full backup of /dev/hda7 into /dev/sda.

To restore from backup backup by dump command :
restore -rf /dev/sda : Restore command restore from the backup file.

QUESTION 437:

You are logged in as root. What command do you run to find out what groups user Certkiller belongs to?

Answer: groups Certkiller

Explanation:

groups command prints group name belonging the user.

Example, groups user1 : prints the all group name in which user belongs

QUESTION 438:

What command is used to view pending jobs for the at command? (Do NOT specify path).

Answer: atq

Explanation:

at command is used to set the job to execute in exact point in time.

Example: at now+ 5 minute

At> poweroff

At>ctl+d

This command will set the schedule to execute the poweroff command after five minutes from now. To display all the queue adding by using the at command use the atq command

QUESTION 439:

Which of the following lines would you expect to see in the file /etc/services?

- A. in.tftpd: LOCAL
- B. tftp dgram upd wait root /usr/sbin/tcpd in.tftpd
- C. tftp 69/tcp
- D. udp 17 UDP

Answer: C

Explanation:

/etc/services file maps the TCP/UDP ports to common resources. See the example

tcpmux 1/tcp

tcpmux 1/udp

rje 5/tcp

rje 5/udp

echo 7/tcp

echo 7/udp

FTP services uses the port 21 and 20, telnet 23, ssh 22, smtp 25 pop3 110 etc maps that port to services in /etc/services file

tftp service runs on port 69 so, that entry has written in /etc/services file.

QUESTION 440:

A new department's local area network has to be connected to the existing LAN using a router. This new department's LAN uses IP addresses from 192.168.112.64/26 and the first free IP address there was reserved for the router. How many IP addresses were left for other hosts to be connected?

- A. 63
- B. 24
- C. 61
- D. 42

Answer: C

Explanation: IP address classified into different classes. Class A, B, C, D and E. Among all these classes only class A, B C are usable and Class D use to Broad Cast and E for Research.

Class A: 1.0.0.0 to 127.255.255.255 where 10.0.0.0 to 10.255.255.255 is Private IP as well 127 reserve for Loopback.

Class B: 128.0.0.0 to 191.255.255.255 Where 172.168.0.0 to 172.31.255.255 is Private IP

Class C: 192.0.0.0 to 223.255.255.255 where 192.168.0.0 to 192.168.255.255 is Private IP

Class D: 224.0.0.0 to 239.255.255.255 called Multicasting Address

Class E : 240.0.0.0 to 254.255.255.255 Reserved For Research.

According to question subnetted by 26 bits so 11000000 6 bits for hosts address

Number of usable IP Address on one subnet is : $2^6 - 2 = 62$

So First IP Address is for router and remaining 61 IP Addresses can assign to host.

QUESTION 441:

Your senior system administrator asked you to edit the /etc/inetd.conf file in order to disable the time service. After doing so, what would be the next thing to do?

- A. Reboot the machine
- B. Restart the inetd
- C. Find the PID of inetd and kill it with kill -15
- D. Find the PID of inetd and send it a SIGHUP

Answer: D

<http://www.faqs.org/docs/securing/chap5sec36.html>

QUESTION 442:

You want to make the directory /home/Jack available via NFS. Which option do you have to use to grant read permission for the root user on the NFS mounted file system?

- A. no_root_squash
- B. root_squash
- C. root(rw)
- D. For safety, the NFS protocol does not allow this?

Answer: A

Explanation:

Entries in /etc/exports are exported with root_squashing turned on.

This ensures that requests from the root user on a client machine are denied root access to root-owned files on a server machine. Such requests are mapped instead to a uid such as 65534. This behaviour can be defeated with the no_root_squash option but this not recommended.

QUESTION 443:

CORRECT TEXT

You need an additional email address for a user in your department. You decide to add just an alias on your sendmail email server. What command must be executed to make the changes take effect?

Answer: newaliases

Explanation: /etc/aliases file is used to send the mail to different address then coming address.

Syntax: boob: peter : means mail of boob will get by peter. After modifying the file /etc/aliases you should re-build the database using newaliases command

QUESTION 444:

When you run the command newaliases, it will:

- A. ask for input on stdin to create new mail aliases.
- B. restart sendmail.
- C. remove the aliases currently configured.
- D. rebuild the aliases database for the file /etc/aliases

Answer: D

Explanation:

/etc/aliases file is used to send the mail to different address then coming address.

Syntax: boob: peter : means mail of boob will get by peter. After modifying the file /etc/aliases you should re-build the database using newaliases command

QUESTION 445:

Which of the following commands will lock the user foobar's account?

- A. userdel -r foobar
- B. moduser -l foobar
- C. usermod -L foobar
- D. userconf -l foobar

Answer: C

Explanation:

usermod command is used to modify the user accounts.

To lock the user account:

usermod -L username

To unlock the user account

usermod -U username

QUESTION 446:

You are using iptables to protect your private network but allow it to access the Internet. What command do you run to view the current list of rules for masquerading?

- A. iptables -L masquerade
- B. iptables -t filter -L
- C. iptables -t block -L
- D. iptables -t nat -L

Answer: D

Explanation:

iptables is used to set up, maintain and inspect the tables of IP packet filter rules in the Linux kernel. Several different tables may be defined, each table contains a number of built-in chains and may also contain user-defined chains. Each chain is a list of rules which can match a set of packets. Each rule specifies what to do with a packet that matches this is called target.

You can list the policy and rules of iptables using the iptables -L command

Output will get in this syntax:

target prot opt source destination

Default table is filter: when you use the iptables -L it will display the chains and rules of filter table.

To list rules of masquerading:

iptables -t nat -L

QUESTION 447:

A remote logging system computer with a host name of foobar is being installed on the local network. What line in the system message configuration file will send all system messages to the remote computer?

- A. *.* foobar.*
- B. *.* @foobar
- C. *=foobar
- D. *.foobar
- E. =foobar

Answer: B

Explanation:

The standard system logging daemons syslogd and klogd are both configured with /etc/syslog.conf. It is possible to configure what kind and what amount of system messages is stored in specific log files.

The format is straightforward, the first entry specifies a semi-colon delimited of facility.priority declarations. The second field specifies the log locations, which is usually a file.

Facility ie. cron, mail, authpriv, daemons, kern, lpr, news, syslog, user etc

Priority: debug, info, notice, warning, err, crit, alert, emerg etc

mail.info means à information or more than information of log message of mail service send to /var/log/maillog

. means all facility and all priority send to @foobar host.

QUESTION 448:

In the output of iptables -L -n is the line:

ACCEPT all -- 10.69.70.5 0.0.0.0/

Listed under the INPUT chain. What does this line mean?

- A. That all traffic from 0.0.0.0/0 to 10.69.70.5 is explicitly allowed.
- B. TCP traffic from 10.69.70.5 with all of the TCP flags is allowed.
- C. All traffic from 10.69.70.5 to anywhere is allowed.
- D. The ACCEPT chain is responsible for all traffic from 10.69.70.1 to 0.0.0.0.

Answer: C

Explanation:

iptables is used to set up, maintain and inspect the tables of IP packet filter rules in the Linux kernel. Several different tables may be defined, each table contains a number of built-in chains and may also contain user-defined chains. Each chain is a list of rules which can match a set of packets. Each rule specifies what to do with a packet that matches this is called target.

You can list the policy and rules of iptables using the iptables -L command

Output will get in this syntax:

target prot opt source destination

in output target is Accept, protocol is all no any options, source is 10.69.70.5 and any destination.

Means from 10.69.70.5 to any destination in any port is accepted.

QUESTION 449:

Which of these are name resolution related files? (Choose two)

- A. /etc/hosts
- B. /etc/hsswitch.conf
- C. /etc/lmhosts
- D. /etc/man
- E. /etc/dns.conf

Answer: A,E

Explanation:

/etc/hosts and /etc/resolv.conf file used to resolve the name.

/etc/hosts is called the static file to map name, on each and every hosts you should manually update.

Example: 192.168.0.5 station5.example.com station5 : Which maps the 192.168.0.5 into station5.example.com but you should write this information on each and every hosts.

/etc/resolv.conf : where we specified the name server.

Example: nameserver 192.168.0.1

When user try to access the host, it goes to nameserver to resolve and gets the map name.

QUESTION 450:

You need to run a second Apache server on the same IP address. Which of the following is true?

- A. You cannot run more than one Apache on one IP address.
- B. You have to add a new entry in /etc/services.

- C. The second Apache server must listen on an other port.
- D. The second Apache must be a child process of the first.

Answer: A

Explanation:

We can't run the more than one Web server on Same IP address.

QUESTION 451:

Within smb.conf, which security setting will NOT require that a client connect using a valid username and password before connecting to a shared resource?

- A. security = user
- B. security = share
- C. security = server
- D. security = guest

Answer: D

Explanation:

1. Security=Server : Server Security mode is left over from the time when samba was nt capable of acting as a domain member server. It is highly recommended not to use this feature.
2. Security=User : User level security first because it's simpler. In user-level security, the client sends a session setup request directly following protocol negotiation. This request provides a username and password. The server can either accept or reject the username and password combination.
3. security=share : In share level security, the client authenticates itself separately for each share. It sends a password along with each tree connection request, but it does not explicitly send a username with this operation.

QUESTION 452:

What can you do to recover a lost passphrase for a DSA or RSA authentication key?

- A. Run the ssh-keygen command.
- B. Run the ss --recover command.
- C. A lost passphrase cannot be recovered.
- D. Decrypt the authentication key with gpg.
- E. Decrypt the authentication key with ssh --decrypt.

Answer: C

Reference:

http://www.cs.utah.edu/support/index.php?option=com_content&task=view&id=32&Itemid=58

QUESTION 453:

CORRECT TEXT

The _____ file is the configuration file for ntpd.

Answer: /etc/ntp.conf

Explanation: The ntpd program is an operating system daemon which sets and maintains the system time of day in synchronism with Internet standard time servers.

/etc/ntp.conf : Default configuration file.

/etc/ntp/keys : The default name of the key file

/etc/ntp/ntpervers : The file contains the NTP server to synchronize the time.

QUESTION 454:

CORRECT TEXT

When adding a new user to the system using standard Linux commands, which directory contains the initial files copied to the new user's home directory?

Answer: /etc/skel

Explanation: /etc/skel directory is called the template directory which contains the .bashrc, bash_profile, bash_logout, bash_history etc and which files used to modify the user's environment.

When we use the useradd command, it automatically copy all the contents of /etc/skel into the user's home directory.

QUESTION 455:

A user cannot access the cron scheduling system. What file needs to be configured to provide that access?

Answer: /etc/cron.deny and /etc/cron.allow

Explanation:

If the file cron.allow exists and your username appears in it, you may use or access the cron scheduling. If the cron.allow file does not exist and the file cron.deny does, you must not be listed in cron.deny to use cron schedule. If neither file exists the default behaviour is not allow all users to schedule jobs, with cron.

QUESTION 456:

In which file can you find these lines?

alias eth0 ne2k-pci

options ne2k-pci io=0x300 irq=5

Answer: /etc/modules.conf

Answer: /etc/modprobe.conf

Explanation:

/etc/modules.conf or /etc/modprobe.conf file contains the aliases of modules as well as parameter i.e aliases for ethernet card, sound card etc.
i.e alias eth0 8139too : Actually modules of device is 8139too and creating the aliases to eth0

QUESTION 457:

The correct command to view "verbose" line printer queue information is:

- A. lpg -l
- B. lpg -all
- C. lpq --verbose
- D. lpq -a

Answer: D

Explanation:

lpq command shows the current print queue status on the named printer.

Example: lpq : List the current print queue of default printer

lpq -Pprinter1 : List the print queue of printer1

lpq -a -Pprinter1 : -a option reports jobs on all printers.

QUESTION 458:

What command should be entered to print and then delete the filem foobar.txt?

- A. lpr -o delete foobar.txt
- B. lpr -d foobar.txt
- C. lpr -r foobar.txt
- D. lpr -o remove foobar.txt

Answer: C

Explanation:

lpr command prints the files, when we use the lpr command without any option, it will print the document as well as document put as previous state. -r option helps to remove the file after printing.

QUESTION 459:

In what section of the man pages would you expect to find the man page that documents `/dev/null`?

Answer: `man -K /dev/null`

Explanation:

-K option of man page helps to search for the specified string in all man pages.

QUESTION 460:

You want to change the file that contains the message which is used at the login prompt when users log in locally. Please enter the file including the path.

Answer: `/etc/issue`

Explanation:

`/etc/issue` file is called pre-login message and identification file, Whereever message you write into this file will display at local login prompt and `/etc/issue.net` is for remote login prompt i.e telnet.

QUESTION 461:

You are looking into a new script you received from your senior administrator. In the very first line you notice a `#!` followed by a path to a binary. The shell will:

- A. Ignore the script.
- B. Use that binary to interpret the script.
- C. Use that binary to compile the script.
- D. Be placed by that binary.

Answer: B

Explanation:

On Every Script file, we should write the path of binary interpreter
Example: `#!/bin/bash` where bash is the interpreter of bash shell scripts.

QUESTION 462:

Which command will delete the environment variable, `FOOBAR`?

- A. `unset FOOBAR`
- B. `del $FOOBAR`
- C. `export FOOBAR`

D. export FOOBAR=

Answer: A

Explanation:

unset command is used to delete the environmental variable or shell variable.

Example: X=10

echo \$X (Available)

unset X

echo \$X (not available)

QUESTION 463:

The _____ file maps TCP and UDP ports to common resources.

Answer: /etc/services

Explanation:

/etc/services file maps the TCP/UDP ports to common resources. See the example

tcpmux 1/tcp

tcpmux 1/udp

rje 5/tcp

rje 5/udp

echo 7/tcp

echo 7/udp

FTP services uses the port 21 and 20, telnet 23, ssh 22, smtp 25 pop3 110 etc maps that port to services in /etc/services file

QUESTION 464:

Which IP protocol is connectionless and unreliable?

Answer: UDP

Explanation:

UDP provides a service for applications to exchange messages. Unlike TCP, UDP is connectionless and provides no reliability, no windowing, and no reordering of the received data. However, UDP provides some functions of TCP, such as data transfer, segmentation, and multiplexing using port numbers, and it does so with fewer bytes of overhead and with less processing required.

QUESTION 465:

When using PAP and PPP, the /etc/ppp/pap-secrets file must be:

- A. world-readable.
- B. readable only by the ppp user.
- C. readable only by root.
- D. readable and executable by user root and group ppp.

Answer: C

Explanation:

By default permission of /etc/ppp/pap-secrets is:

```
-rw----- 1 root root 231 Jan 3 09:25 /etc/ppp/pap-secrets
```

QUESTION 466:

What are the addresses falling into the range of 224.0.0.0 through 254.0.0.0?

- A. Class C network
- B. Class B network
- C. This is an experimental address range.
- D. This is a broadcast range.

Answer: C,D

Explanation:

IP address classified into different classes. Class A, B, C, D and E.

Among all these classes only class A, B C are usable and Class D use to Broad Cast and E for Research.

Class A: 1.0.0.0 to 127.255.255.255 where 10.0.0.0 to 10.255.255.255 is Private IP as well 127 reserve for Loopback.

Class B: 128.0.0.0 to 191.255.255.255 Where 172.168.0.0 to 172.31.255.255 is Private IP

Class C: 192.0.0.0 to 223.255.255.255 where 192.168.0.0 to 192.168.255.255 is Private IP

Class D: 224.0.0.0 to 239.255.255.255 called Multicasting Address

Class E : 240.0.0.0 to 254.255.255.255 Reserved For Research.

QUESTION 467:

Which of the following lines would you find the file /etc/hosts?

- A. order hosts,bind
- B. 192.168.168.4 dns-server
- C. hosts: files,dns
- D. domain mycompany.com

Answer: B

Explanation:

/etc/hosts file maps the name of host to IP address. You need to map in each and every host.

Example:

192.168.0.254 server1.example.com server1

which maps the server1.example.com or server1 into 192.168.0.254.

QUESTION 468:

CORRECT TEXT

You already checked the manpages on PPPD. You need to find more information on PPPD related programs. Fill in the command without arguments and options to use.

Answer: apropos

Explanation: Each manual page has a short description available within it. Apropos searches the descriptions for instances of keyword. Keyword is usually a regular expression, or may contain wildcards, or match the exact keyword.

QUESTION 469:

What is a valid target for IPTABLES?

- A. TCP
- B. LOG
- C. UDP
- D. NAT

Answer: B

Explanation: Each firewall rule inspects each IP packet and then tries to identify it as the target of some sort of operation. Once a target is identified, the packet needs to jump over to it for further processing. Valid targets are: ACCEPT, DROP, LOG, REJECT, DNAT, SNAT and MASQUERADE

QUESTION 470:

What is a line from the file /etc/host.conf?

- A. order hosts,bind
- B. 192.168.2.4 dns-server
- C. hosts: files dns
- D. mydomain test.com

Answer: A

Explanation: The file /etc/host.conf contains configuration information specific to the resolver library. It should contain one configuration keyword per line, followed by appropriate configuration information. The keywords recognized are order, trim, multi, nospoof, spoof, and reorder.

QUESTION 471:

What are the first two bytes of a MD5 hash called?

- A. salt
- B. magic
- C. magic bytes
- D. encrypted bytes

Answer: A

Explanation: Recently, a number of projects have created MD5 "rainbow tables" which are easily accessible online, and can be used to reverse many MD5 hashes into strings that collide with the original input, usually for the purposes of password cracking. Salts helps protecting against rainbow tables as they, in effect, extend the length and potentially the complexity of the password. If the rainbow tables do not have passwords matching the length (e.g. 8 bytes password, and 2 bytes salt, is effectively a 10 byte password) and complexity (non-alphanumeric salt increases the complexity of strictly alphanumeric passwords) of the salted password, then the password will not be found. If found, one will have to remove the salt from the password before it can be used.

QUESTION 472:

What are the first two characters of an MD5 hashed password?

- A. \$1
- B. \$2
- C. \$3
- D. \$4

Answer: A

Explanation: MD5 hashes use the prefix \$1\$ on all passwords in /etc/shadow

QUESTION 473:

How can you delete all rules from a chain in IPTABLES?

- A. iptables -P

- B. iptables -F
- C. iptables -R
- D. iptables -E

Answer: B

Explanation: -F stands for flush. It will flush the selected chain (all the chains in the table if none is given). This is equivalent to deleting all the rules one by one.

QUESTION 474:

How can you find all possible parameters which you may use when loading a specific module?

- A. modinfo -p
- B. modinfo --list
- C. modprobe -...

Answer: A

Explanation: modinfo extracts information from the Linux Kernel modules given on the command line. -p, param will show you possible parameters.

QUESTION 475:

User space daemon ?

- A. klog
- B. klogd
- C. syslog
- D. syslogd

Answer: D

Explanation: Daemons are often named with a d in the end (like klogd and syslogd). klogd is a kernel space log daemon, and syslogd is a user space log daemon.

QUESTION 476:

You are a junior system engineer and have been asked to refresh the webpages for a busy website. You don't want to break the connections. What command can you use?

- A. apachectl restart
- B. apachectl reload
- C. apachectl graceful

D. /etc/init.d/httpd restart

Answer: C

Explanation: Reload restarts the Apache daemon by sending it a SIGUSR1. If the daemon is not running, it is started. This differs from a normal restart in that currently open connections are not aborted. A side effect is that old log files will not be closed immediately.

QUESTION 477:

You want to bypass printing filters using lpr. What command is correct?

- A. lpr -o nofilter
- B. lpr -r
- C. lpr - o raw
- D. lpr -l

Answer: C

Explanation: -o raw specifies that the print file is already formatted for the destination and should be sent without filtering.

QUESTION 478:

The command "echo \$\$" outputs 14292 to the screen. What does the output mean?

- A. the PID of your active shell
- B. the PID of
- C. the PID of the last command
- D. the PID of the last backgrounded command

Answer: A

Explanation: \$\$ evaluates to the pid of the current shell

QUESTION 479:

How can you verify the integrity of the /etc/passwd file?

- A. pwchk
- B. pwck
- C. chkpw
- D. ckpw

Answer: B

Explanation: pwck verifies the integrity of the system authentication information. All entries in the /etc/passwd and /etc/shadow are checked to see that the entry has the proper format and valid data in each field. The user is prompted to delete entries that are improperly formatted or which have other incorrectable errors.

QUESTION 480:

Which file is read by the program ldconfig ?

- A. /lib/ld.so
- B. /etc/ld.so.conf
- C. /etc/ld.so/cache
- D. /etc/modules.conf

Answer: B

Explanation: this file is scanned by ldconfig to create the hints files used by the run-time linker /usr/libexec/ld.so to locate shared libraries.

QUESTION 481:

You are the system administrator for a consulting firm where several people use Linux as their desktop operating system. One of your users has installed a commercial publishing program that works under X on a variety of UNIX and Linux platforms. The user made a series of configuration changes regarding the initial window size, location and color. Now, he is having difficulty undoing these changes and is asking for your help. In which file would you think you would most likely find the configuration settings you are seeking to change?

- A. ~/.Xdefaults
- B. ~/.xinitrc
- C. ~/.xconfig
- D. /etc/X11/XF86Config

Answer: A

Explanation: The file called .Xdefaults in the home directory is loaded into the X server using the xrdp program when you start a X session. In this file, each X application has a number of options which can be set, such as reverse video, window size, window location, and many others. You can set these options so that they are set every time you start up an application.

QUESTION 482:

Identify the proper device for the third partition, on the second hard disk on the first IDE controller on a PC system.

- A. /dev/hda3
- B. /dev/hdb3
- C. /dev/hd1b3
- D. /dev/hdc3

Answer: B

Explanation: hda is the first hard disk on the first IDE controller, hdb is the second. Partitions are counted from 1 (not 0) so the third partion should be hdb3 (again, not hdb2)

QUESTION 483:

What is a reasonable command to uninstall a Debian Package from your System?

- A. dpkg -Ra Package
- B. dpkg -R Package
- C. dpkg -r Package
- D. dpkg -ra package

Answer: C

Explanation: -r is for --remove, -R is for --recursive. With -ra all packages unpacked, but marked to be removed or purged in file /var/lib/dpkg/status, are removed or purged, respectively.

QUESTION 484:

After Minor security incident you are instructed by your lead system administrator to verify the RPMs installed on a running system. Which command will create a complete report that you can analyze for changes that my be security related?

- A. rpm -Va >result
- B. rpm -Qavy >result
- C. rpm -Vqt md5 >result
- D. rpm --checksig >result

Answer: A

Explanation: -V is for verify, -a is for all. > result will redirect the results to a file named result.

QUESTION 485:

You need to know where all the configuration files are located for the installed postfix. Assuming it was installed with rpm, which command will list this information for you ?

- A. rpm -qc postfix
- B. rpm -Vc postfix
- C. rpm -ql postfix
- D. rpm -qa postfix

Answer: A

Explanation: rpm {-q | --query}[PACKAGE_NAME] [-a, --all] [-f, --file FILE] [-g, --group GROUP] [-p, --package URLFILE] [--querybynumber NUMBER] [--triggeredby PACKAGE_NAME] [--whatprovides CAPABILITY] [--whatrequires CAPABILITY] [pkgselect-options] [query-options]
-c, --configfiles will list only configuration files (implies -l).

QUESTION 486:

You want to examine the changelog for the installed package postfix. Which command will display the changelog?

- A. rpm -Vc postfix
- B. rpm -qpil postfix
- C. rpm -changelog postfix
- D. rpm -q changelog postfix

Answer: D

Explanation: rpm {-q | --query}[PACKAGE_NAME] [-a, --all] [-f, --file FILE] [-g, --group GROUP] [-p, --package URLFILE] [--querybynumber NUMBER] [--triggeredby PACKAGE_NAME] [--whatprovides CAPABILITY] [--whatrequires CAPABILITY] [pkgselect-options] [query-options]
--changelog Display change information for the package.

QUESTION 487:

You have just upgraded your PC to a 60 gigabyte IDE drive. While partitioning the drive, you notice that only 32 gigabytes are available. Which of the following will most likely allow you to use the entire drive?

- A. Create two smaller partitions of 30 gigabytes each
- B. Set the PC BIOS to use LBA mode
- C. Upgrade the PC BIOS to latest version available

D. Use GRUB or latest version of LILO as a bootloader

Answer: C

Explanation: Not being able to see and use all the space on a new IDE drive is almost always a problem with a old BIOS version.

QUESTION 488:

You have a USB storage device that you can't get working. You have enabled all appropriate USB options in the latest 2.2 kernel but will can't get your device working. What is the most likely the source of the problem?

- A. You have not configured your usb.usermap properly
- B. You are using the Wrong kernel for this type of device.
- C. The USB device is not USB 2.0 compliant
- D. There is a USB resource conflict.

Answer: B

Explanation: The 2.2.18 kernel has some USB support but a 2.4.x or newer kernel is recommended.
